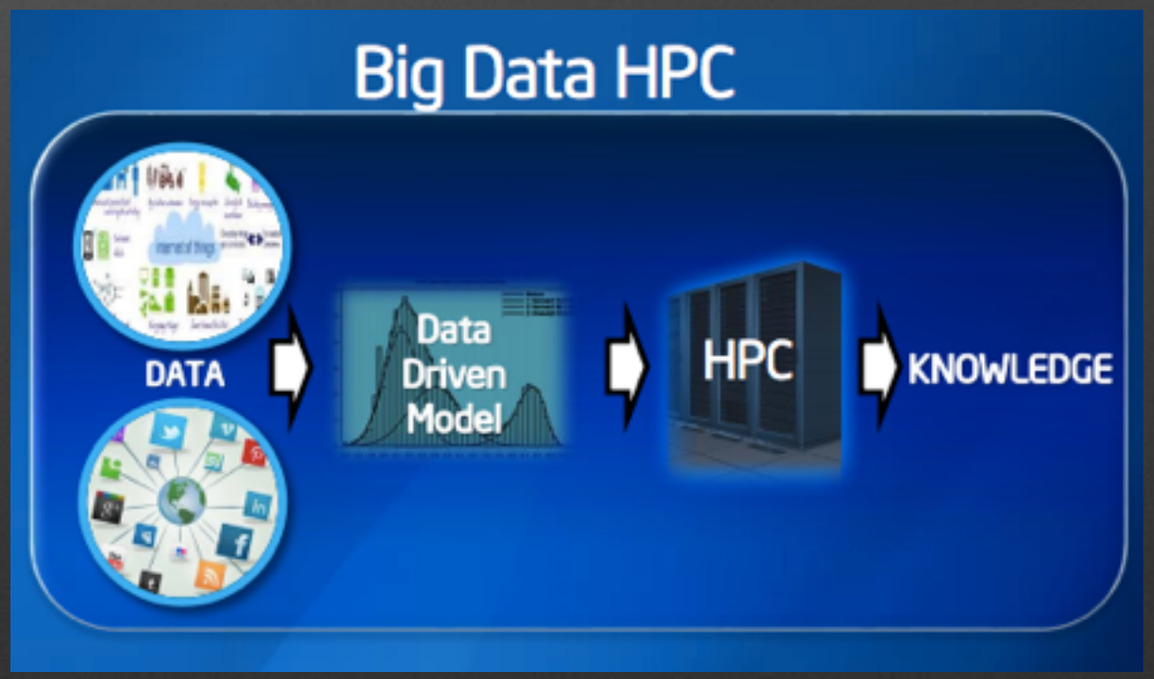
Hydra HPC Training Workshop

June 11-12, 2015

What is HPC?

- High Performance Computing
  - Aggregated computing power
  - Large scale computationally intensive tasks
  - Generally no GUI, must use command line!

Hydra - Smithsonian HPC



Source: http://www3.imperial.ac.uk/businessschool/programmes/msc-data-science/whatisdatascience

What are we covering?

Basic to advanced unix commands

Introduction to Hydra & Job submission

Smart job submission & Job monitoring

Goals

Comfort with command line

Familiarity with computational resources at SI

Increase use of Hydra

Paul Frandsen, OCIO/ORIS

Rebecca Dikow, SIBG

Matt Kweskin, LAB

DJ Ding- OCIO/ORIS

Vanessa González, GGI

Sylvain Korzennik- SAO

OCIO: Office of Research Information Services; SAO: Smithsonian Astrophysical Observatory (Cambridge, MA)

Structure of sessions

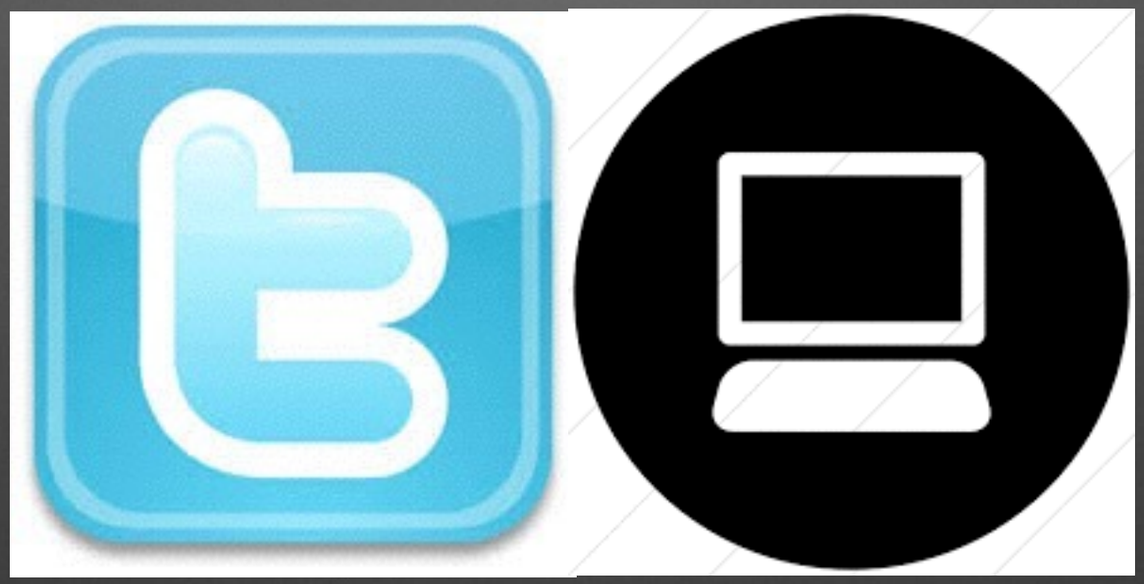
Two sessions per day that include:

- Overview of commands being covered
- Hands on time and learning exercises

Typography conventions:

- Best practice icon 🌻
- Terminal text: `$ sample`

We will take questions via Twitter!



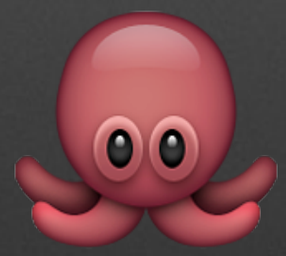
#SIHydraWorkshop

Thank you!

Funds support from:

Under Secretary for Science
Global Genome Initiative (GGI)
Laboratories of Analytical Biology (LAB)
Office the Chief Information Officer (OCIO)
Smithsonian Institute for Biodiversity Genomics (SIBG)

Day I (AM): Unix basics and Hydra connection



AM Outline

1. Unix- what and why
2. Understanding the file systems
3. Basic commands for working with files
4. Hydra connection
5. Practical: Trying out these tools on Hydra

If you know the basics of this content, pull up the man page and dig deeper.

Unix

Unix

- A family of operating systems
- Created in the 1970s
- Multi-user, multi-task
- Very flexible: scriptable, extensible
- Linux+MacOS+Solaris+… = most of the computing world

Why learn Unix

- Long lived- tools learned here will be applicable for your career
- Just about every major technology is built around Unix (especially Linux)

Linux

- Developed in early 90s
- All open source- before there were licenses and fees

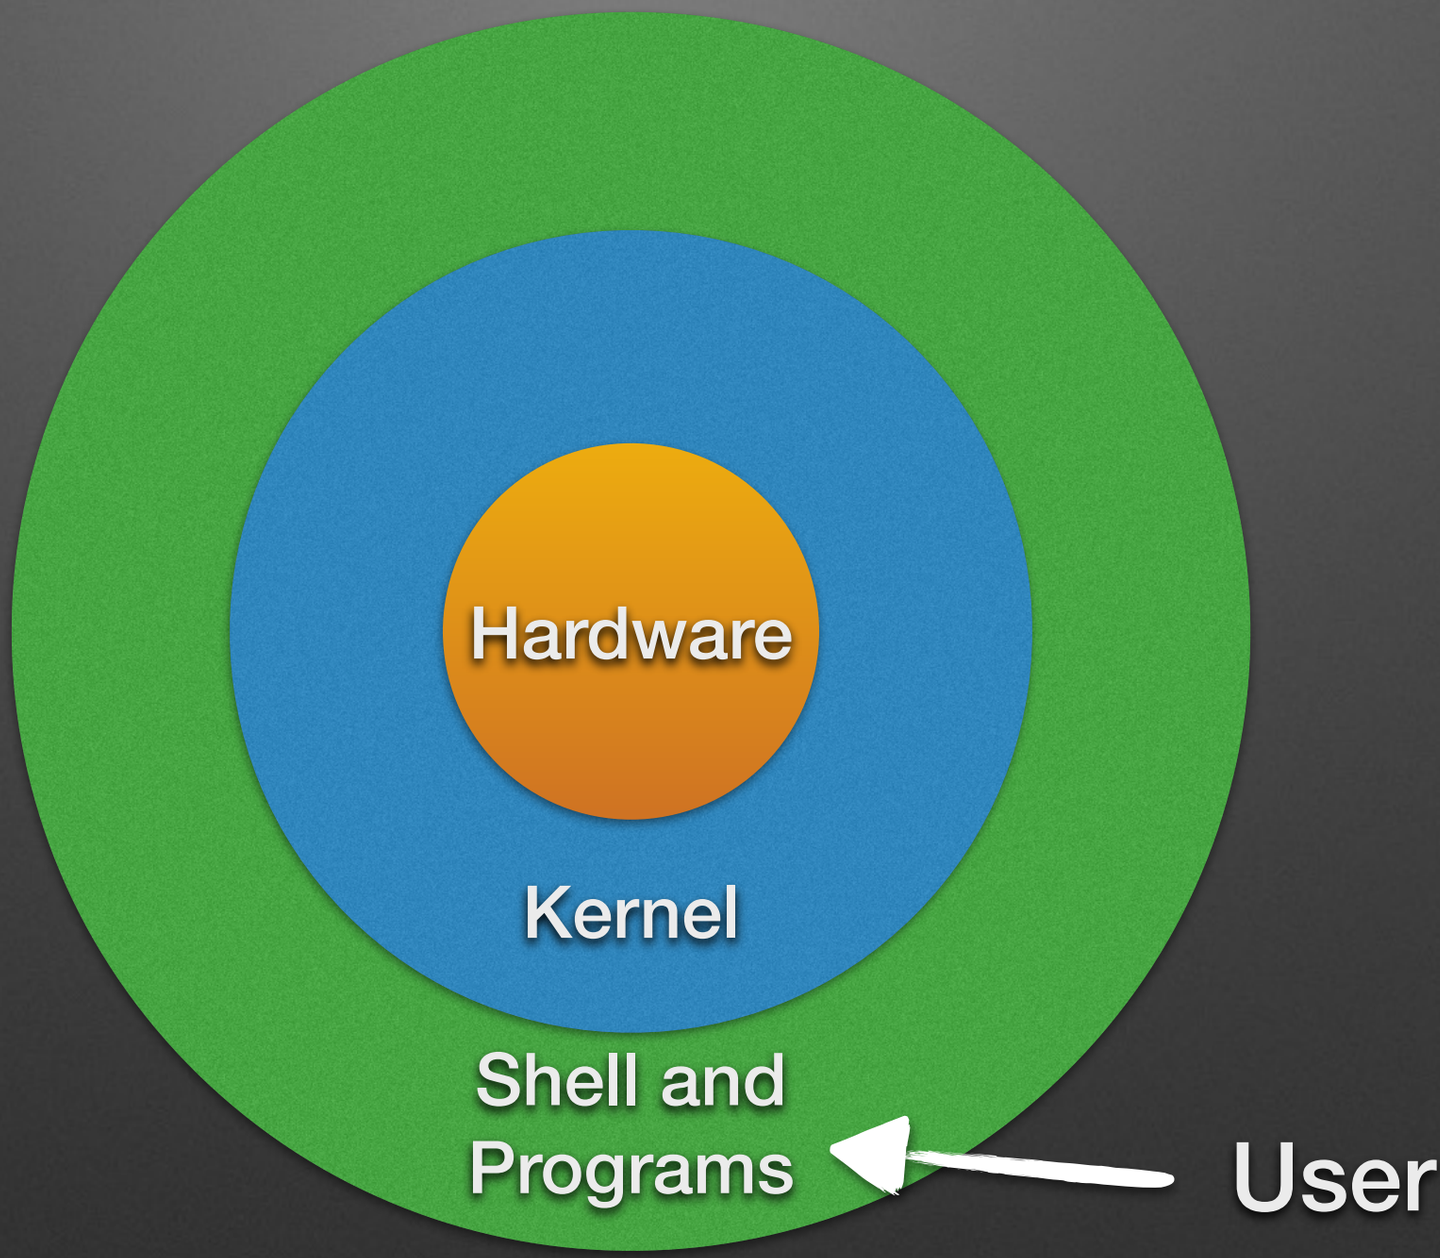
Kernel (communicates with hardware)
developed by Linus Torvalds

+

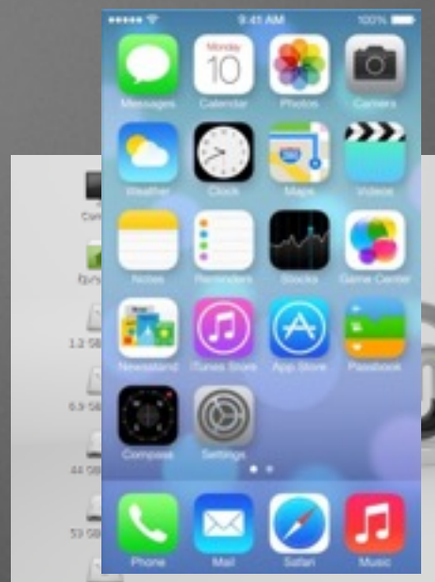
Shell and core programs
developed by Richard Stallman
(GNU = GNU's Not Unix)

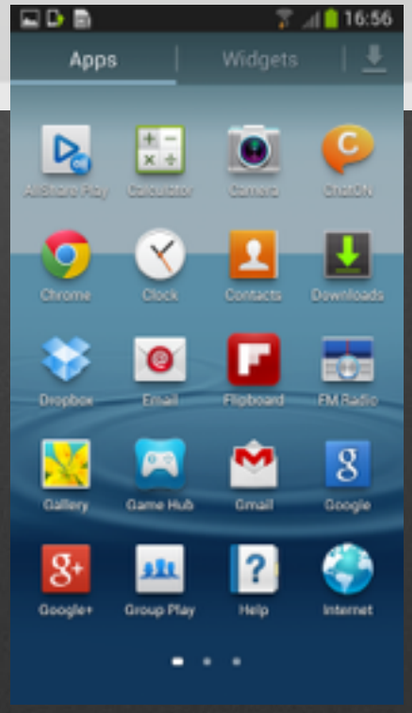
- Hundreds of versions and branches (distributions)
  - Ubuntu, Red Hat, CentOS (on Hydra), SUSE, Debian

Kernel + shell/programs



There can be a GUI





Or no GUI...

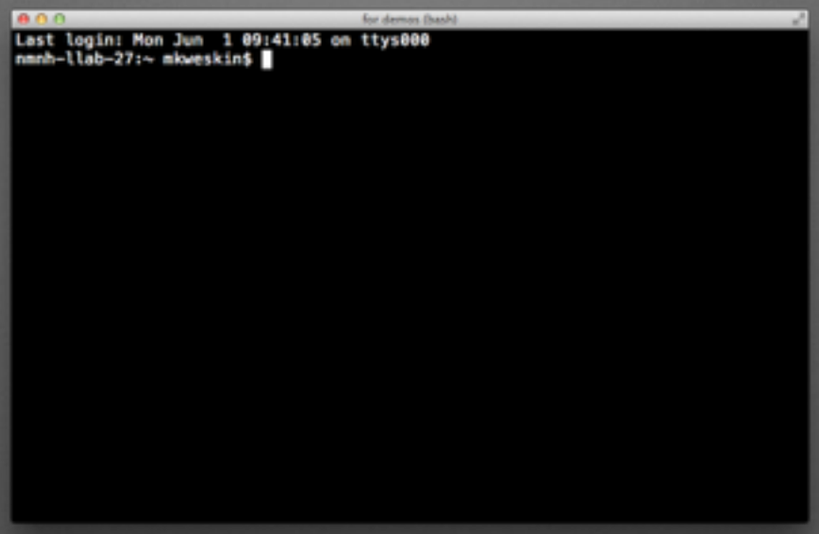
Welcome to the HPC/SI cluster Hydra-3
Documentation is available at https://hydra-3.si.edu
Please change your password every 90 days. Your account will be locked
if it is inactive for 90+7 days, email dingdj@si.edu to unlock it for
you.
To change your password, use the command 'passwd' on the login node
(this host), and then ssh to 'hydra-3' and do the same. If you don't,
your password will be reset to the one on 'hydra-3' (the head node)
where the master records are kept.
[gonzalezv@login-3-1 ~]$

Why command line?

- Analysis programs tend to run like this
- Access
  - To computers via remote login
    - Multiple users can access at one time
- Advantages
  - Tight control on what is being done
  - Batch processing require scripts (commands)
- Shared resource
  - Not sole user of computer

Shell

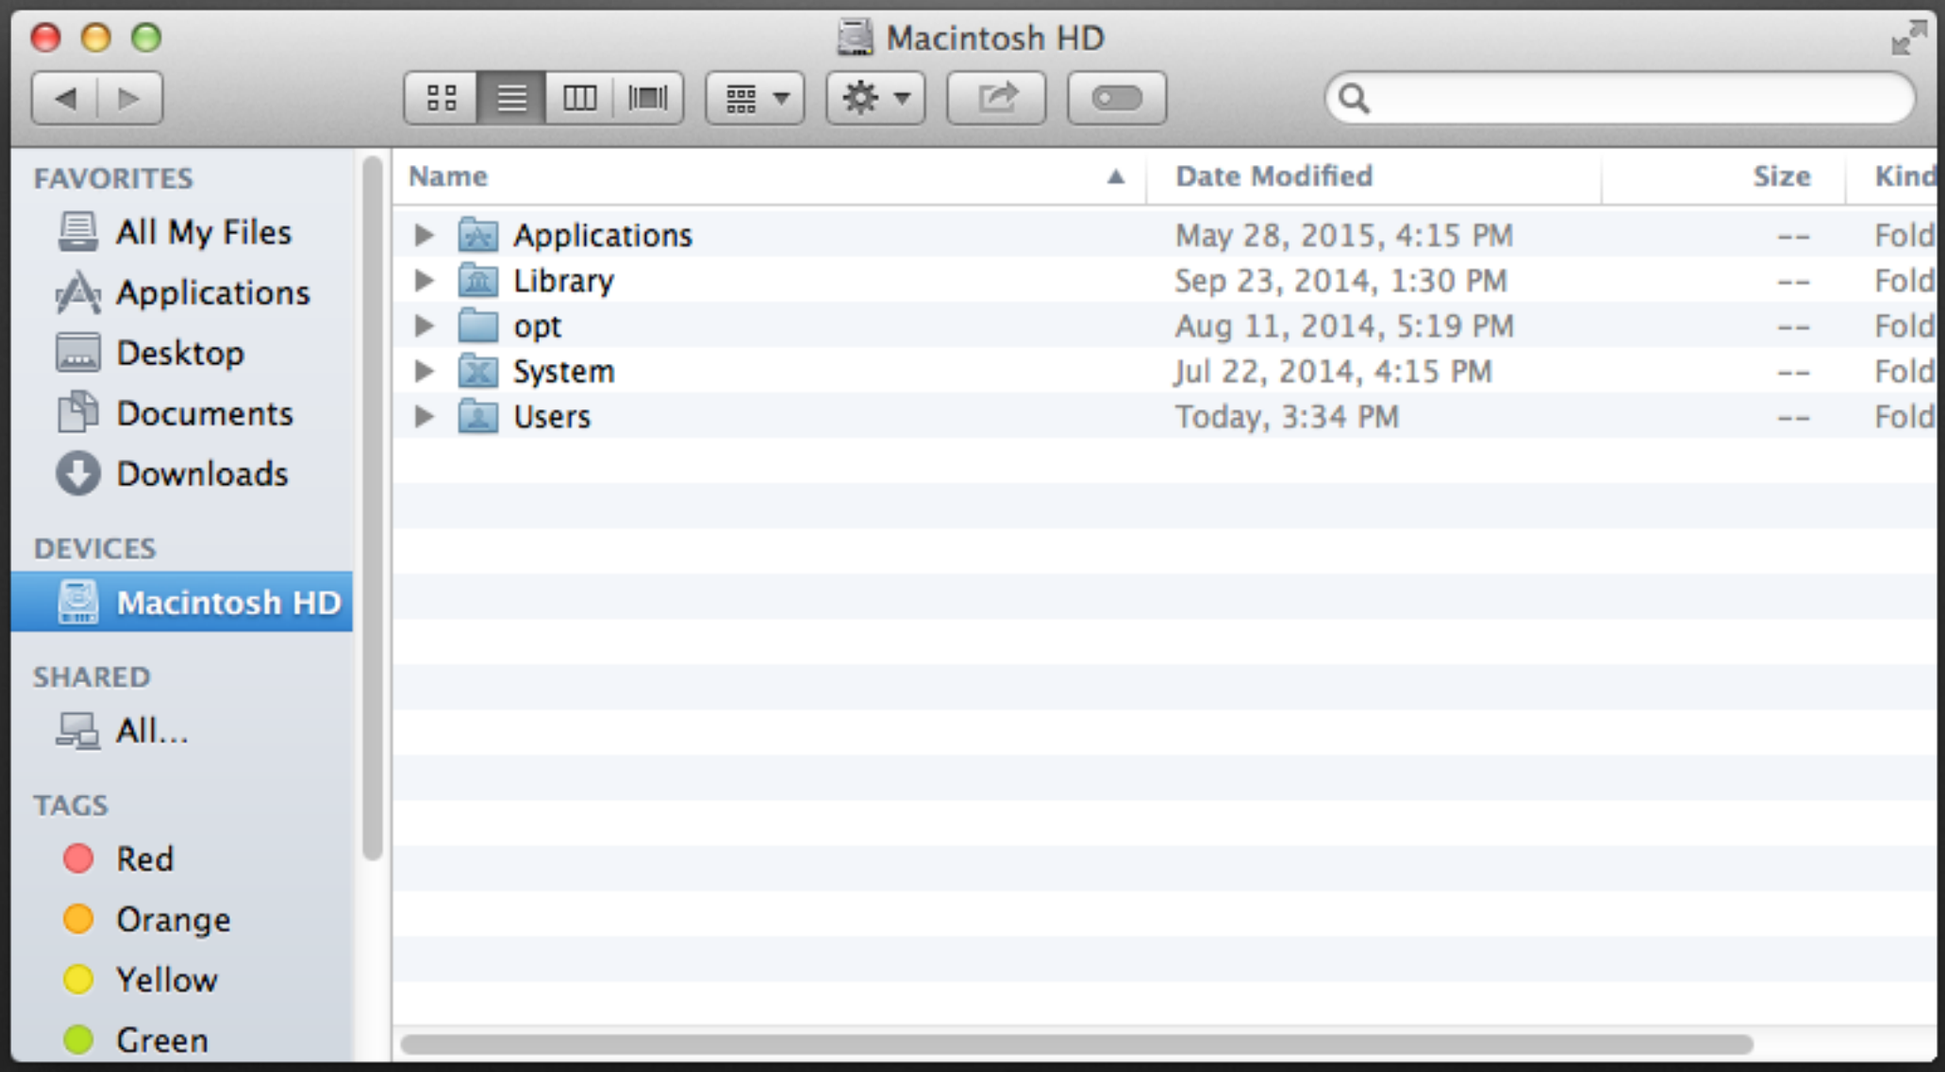


- Lingo for the program that is started when you login
- The command line interpreter- takes and executes your instructions
- Two major shells: `bash` (or `sh`) and `csh` (or `tcsh`)
  - `bash` being taught here and we're using as default for genomics users on Hydra
  - Some formatting differs between shells. You can try another shell

File structure

How things are organized on a disk

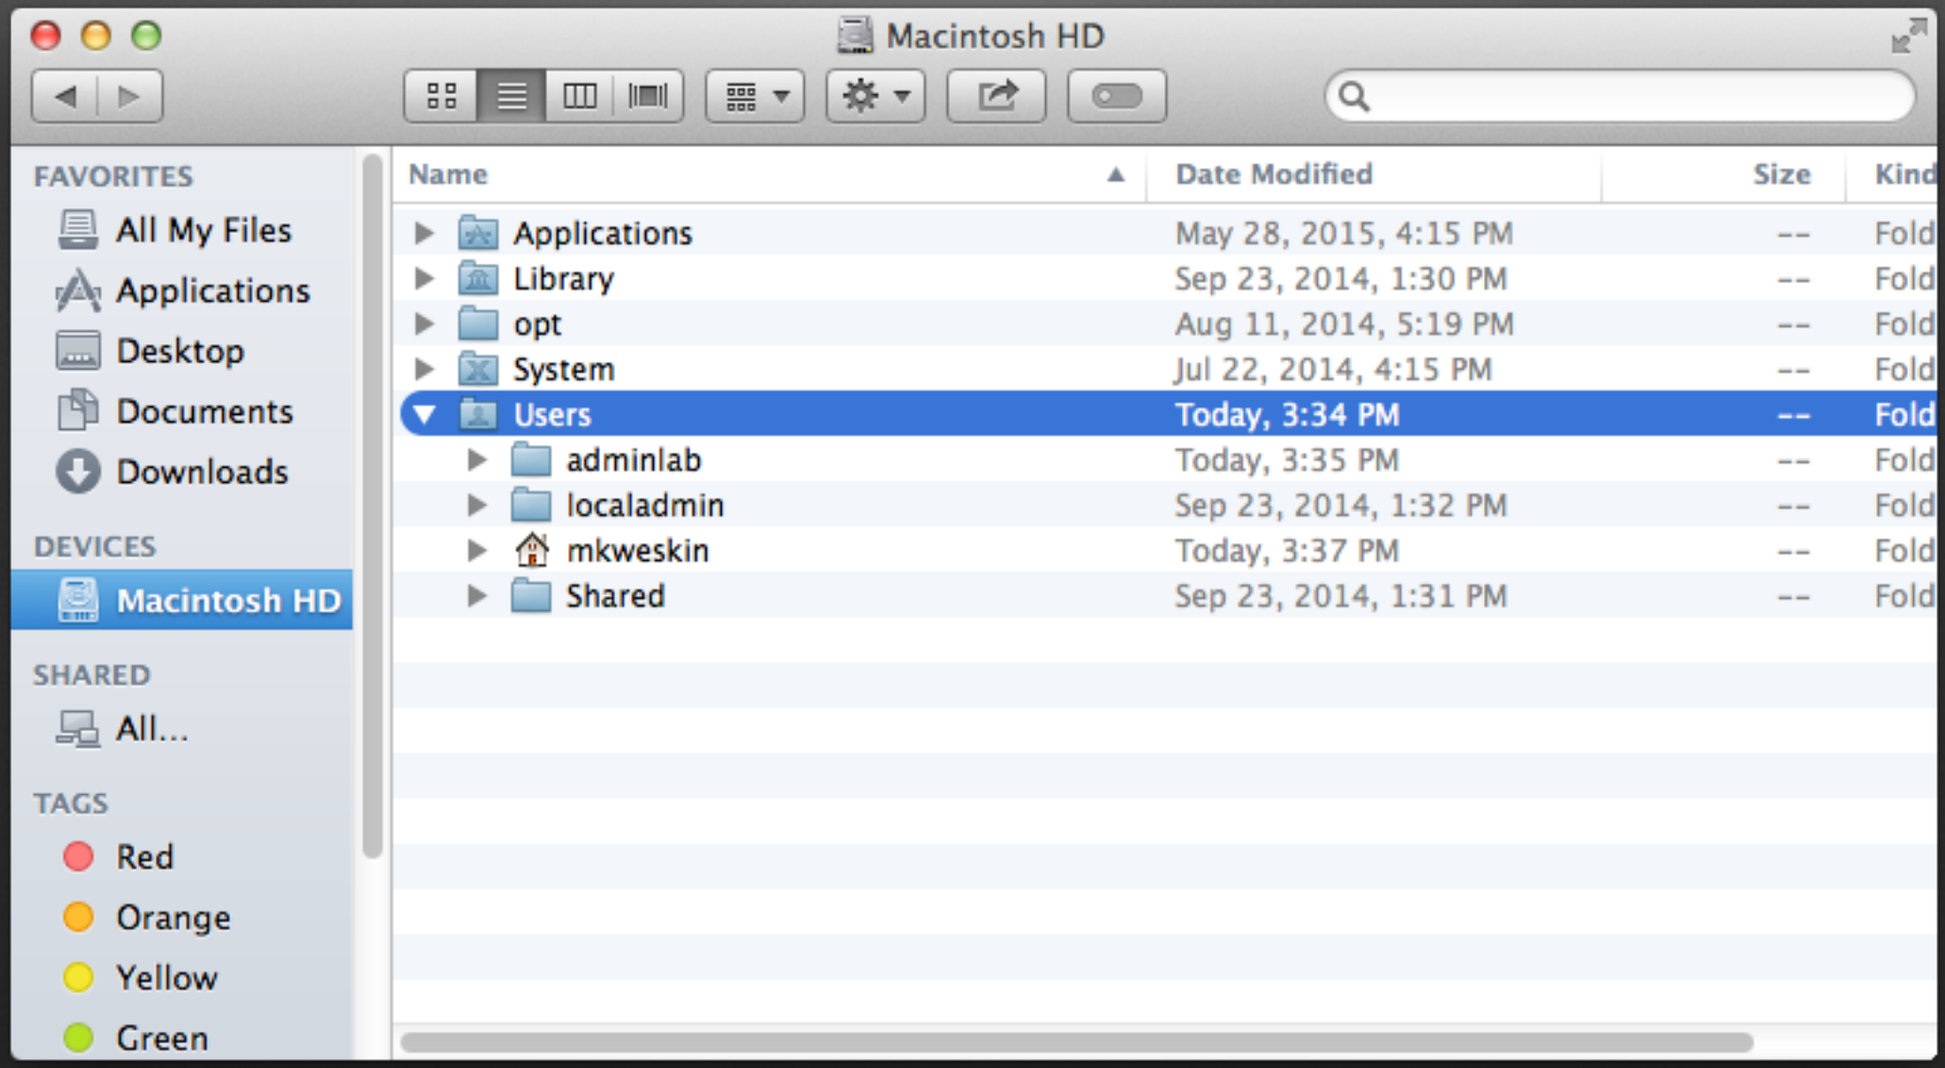
Identifying where things are
Paths



/

/ “Root”: top most directory on a system, everything is inside it

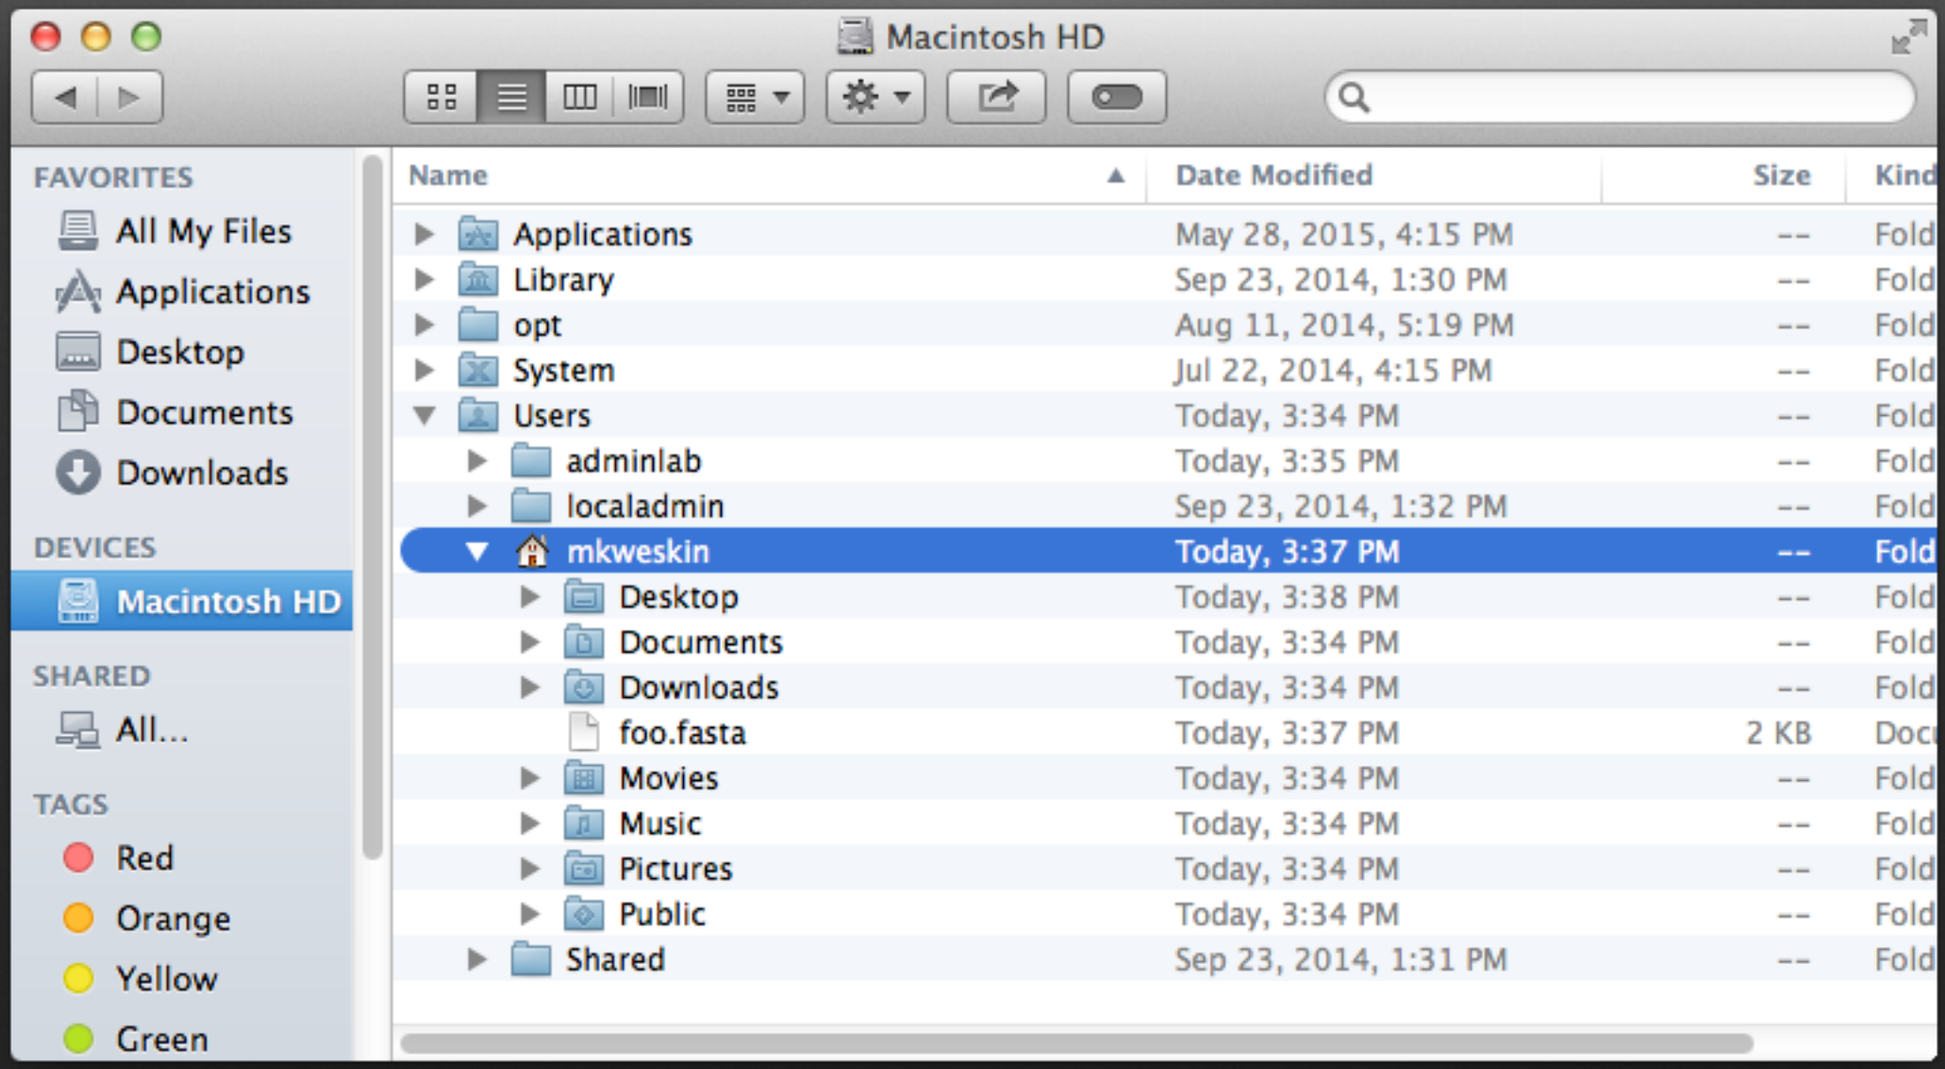
Identifying where things are Paths



`/Users/`

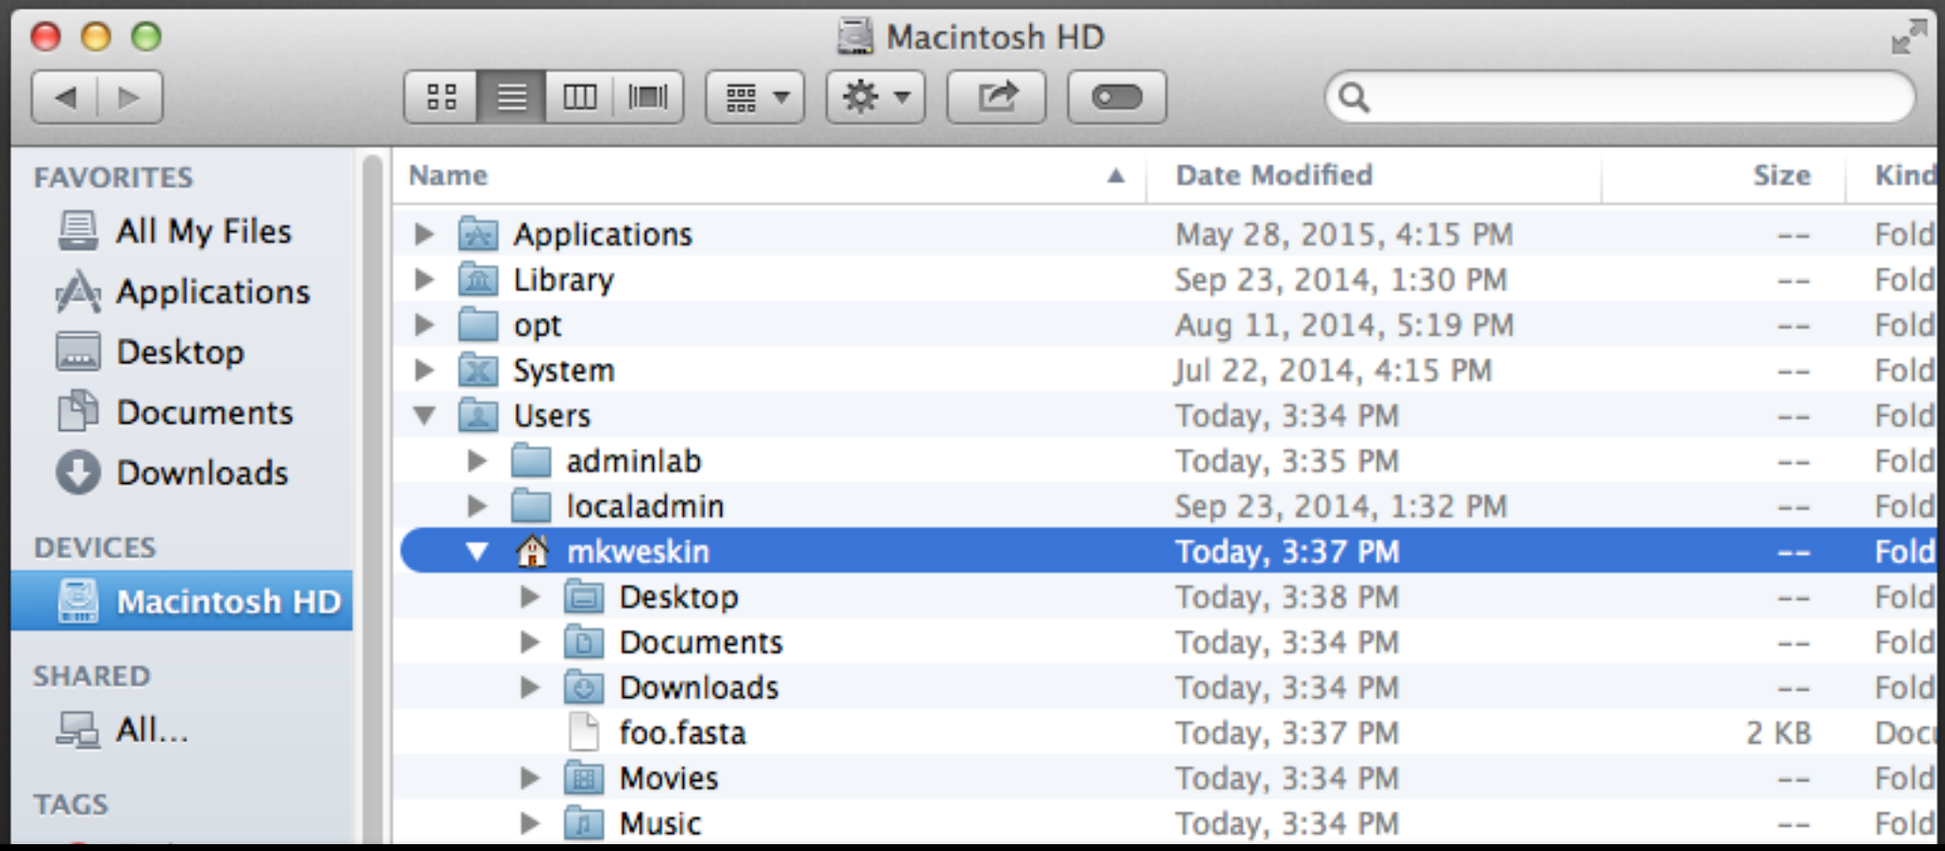
Ending / means a directory

Identifying where things are
Paths



`/Users/mkweskin/`

Identifying where things are Paths

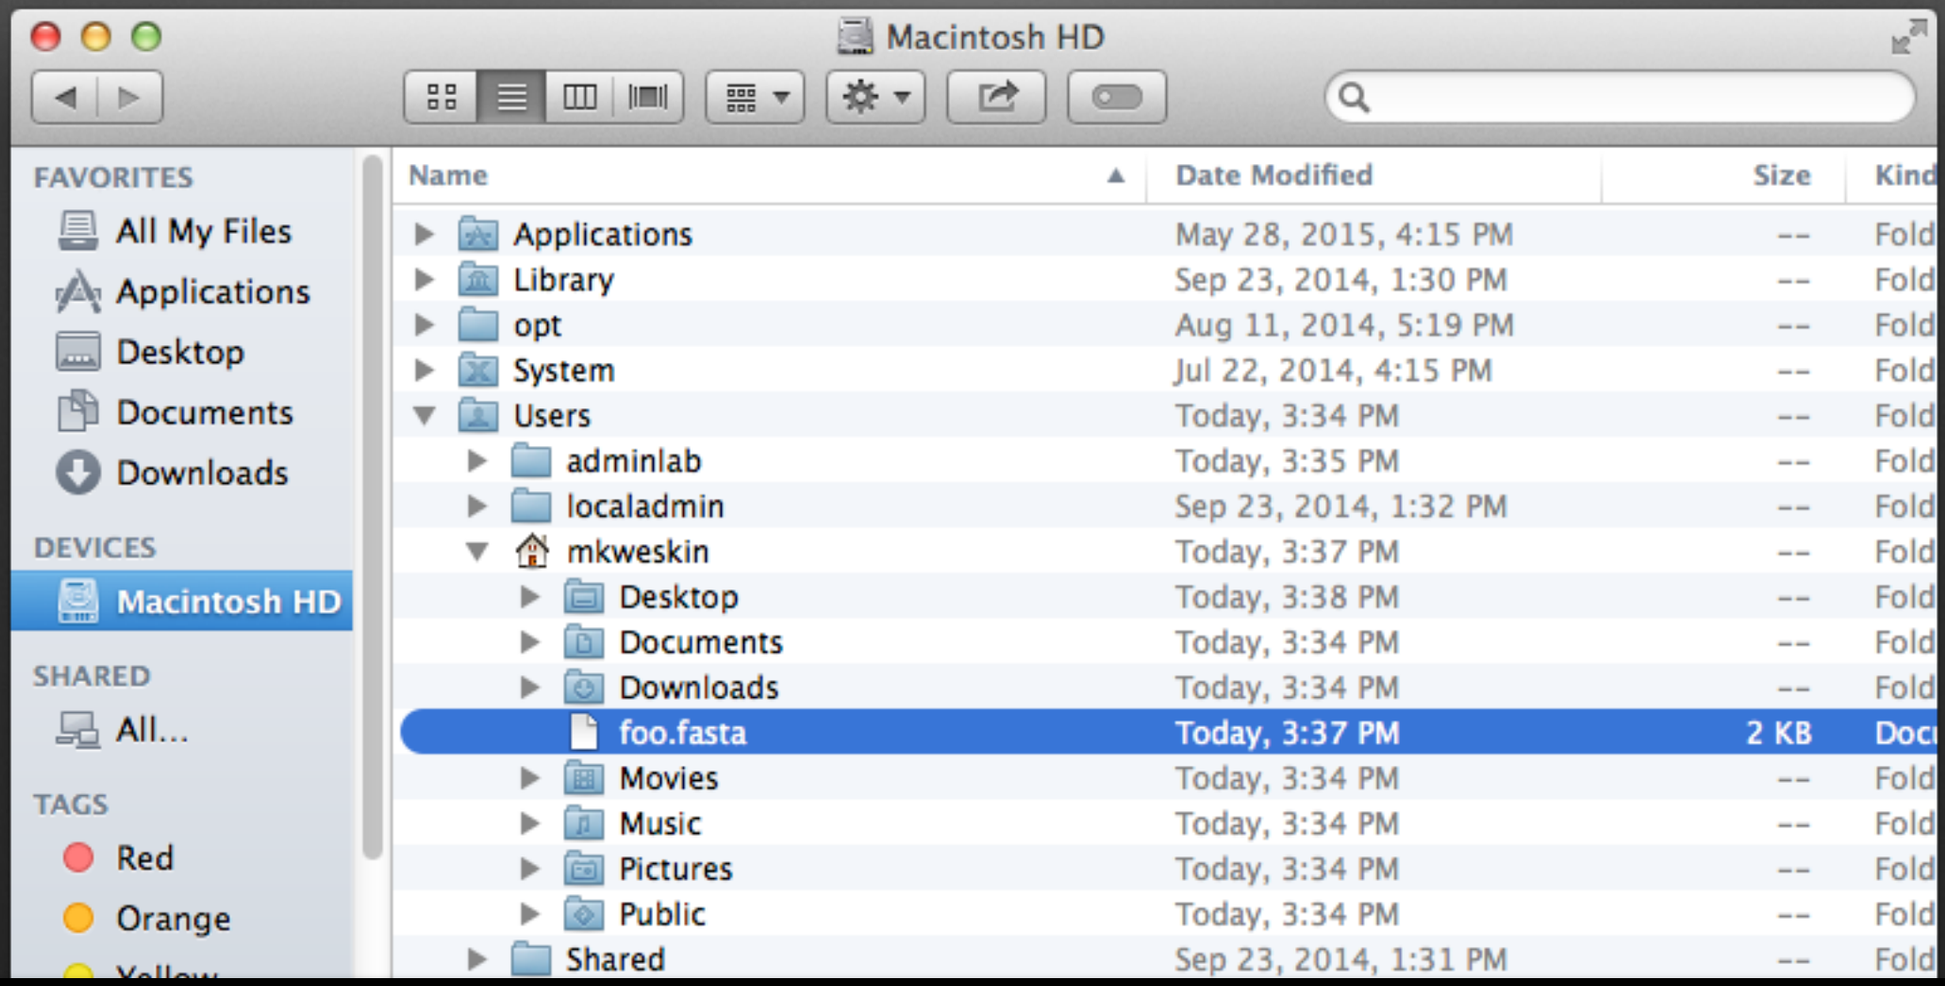


`/Users/mkweskin`

or `~`

(Mac home directory, linux is /home/user)

Identifying where things are Paths



`/Users/mkweskin/foo.fasta`
or `~/foo.fasta`

Absolute vs relative paths

- Absolute file path: starts with a `/`
  - Complete path to the file. Works regardless of current directory.

```
/Users/mkweskin/foo.fasta
```

- Relative file path: starts with another directory or no directory
  - **Depends on current directory**

```
foo.fasta
mkweskin/foo.fasta
../localadmin/bar.fasta
```

Absolute vs relative paths

- Some analysis programs *require full paths* to input files. If the program documentation says full path, give it.

Special files/directories

- `.file` Files/directories starting with a `.` are hidden when you `ls`. Often used for config files, especially in your home directory.
- `.` Refers to the current directory
- `..` Refers to the parent directory

File/Directory Naming

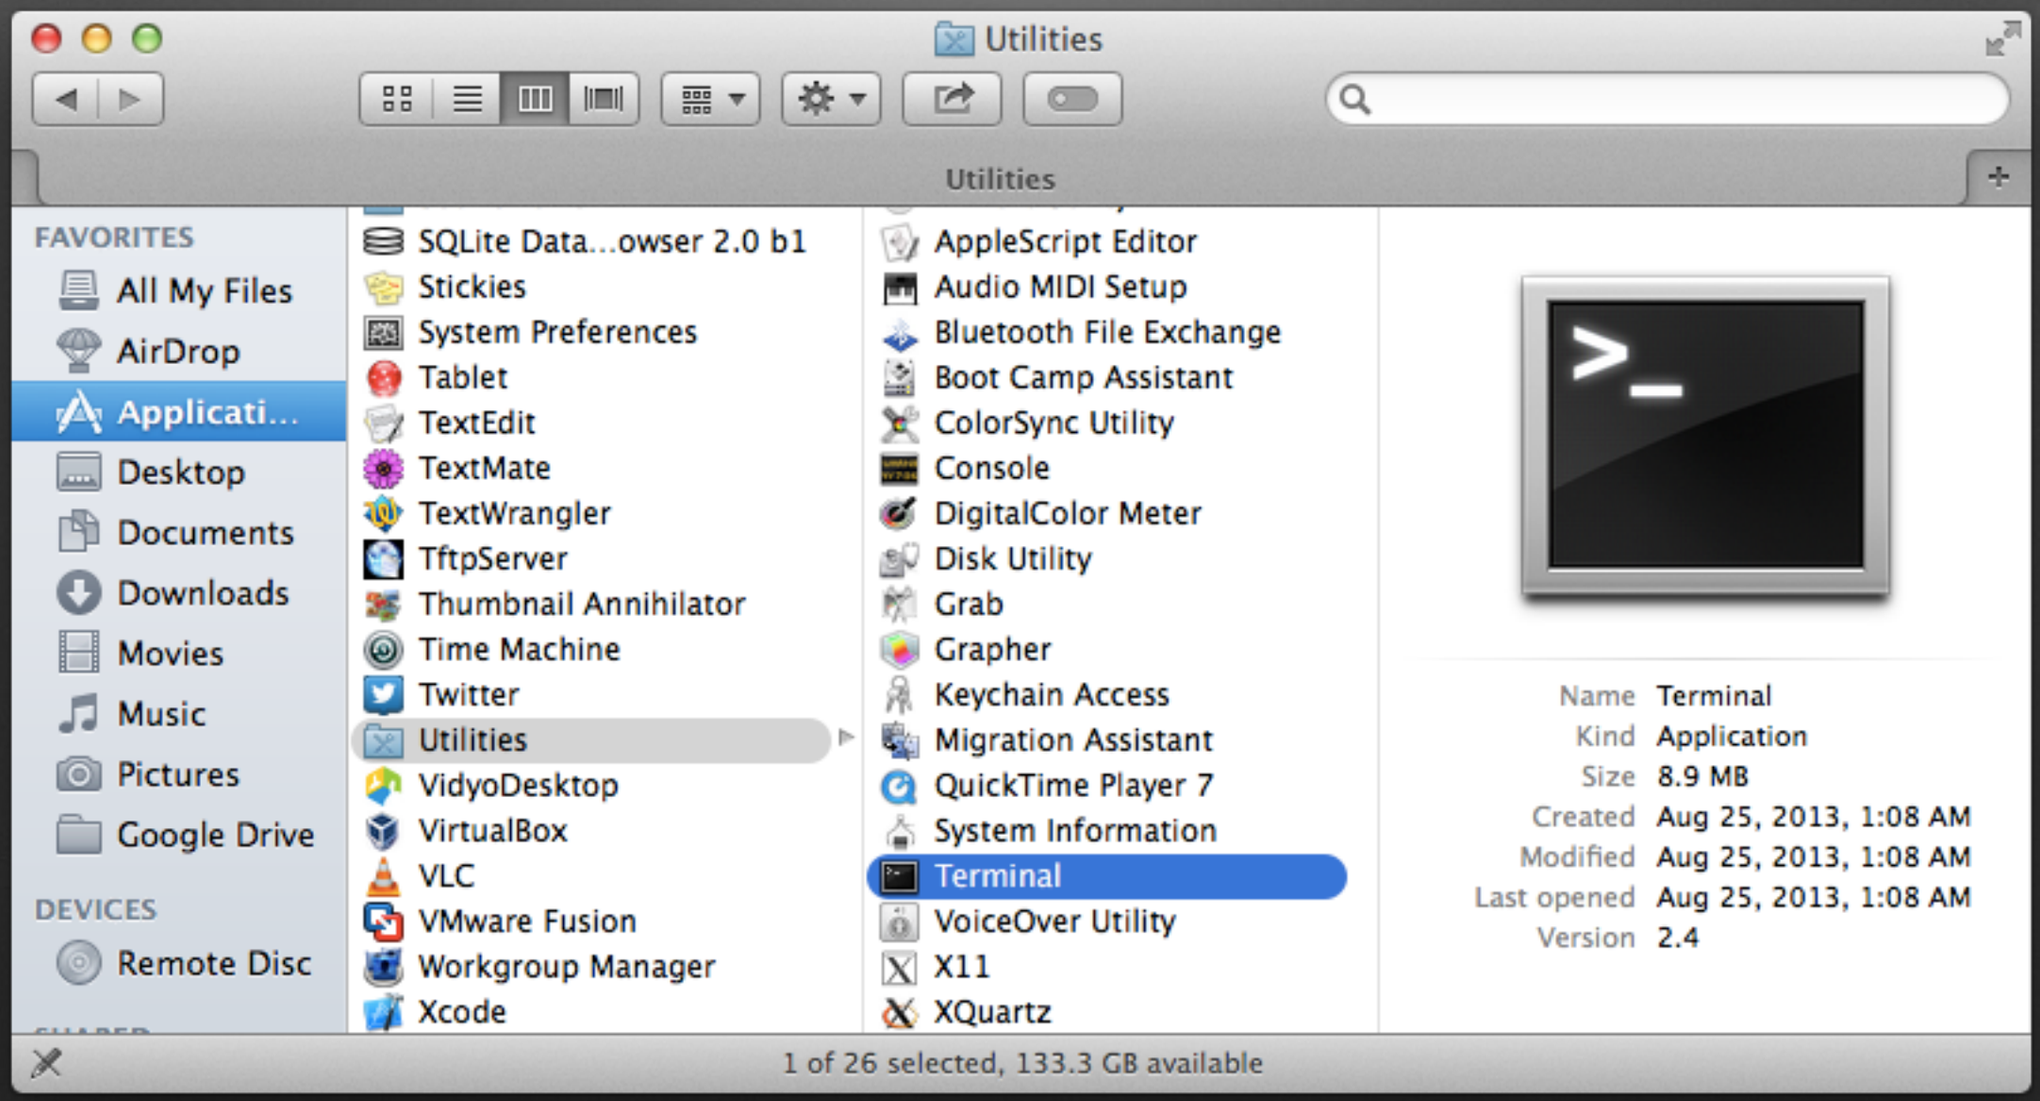
- Names are case sensitive
- There are no rules, just conventions
- Technically you can use just about weird character you want, but DON'T

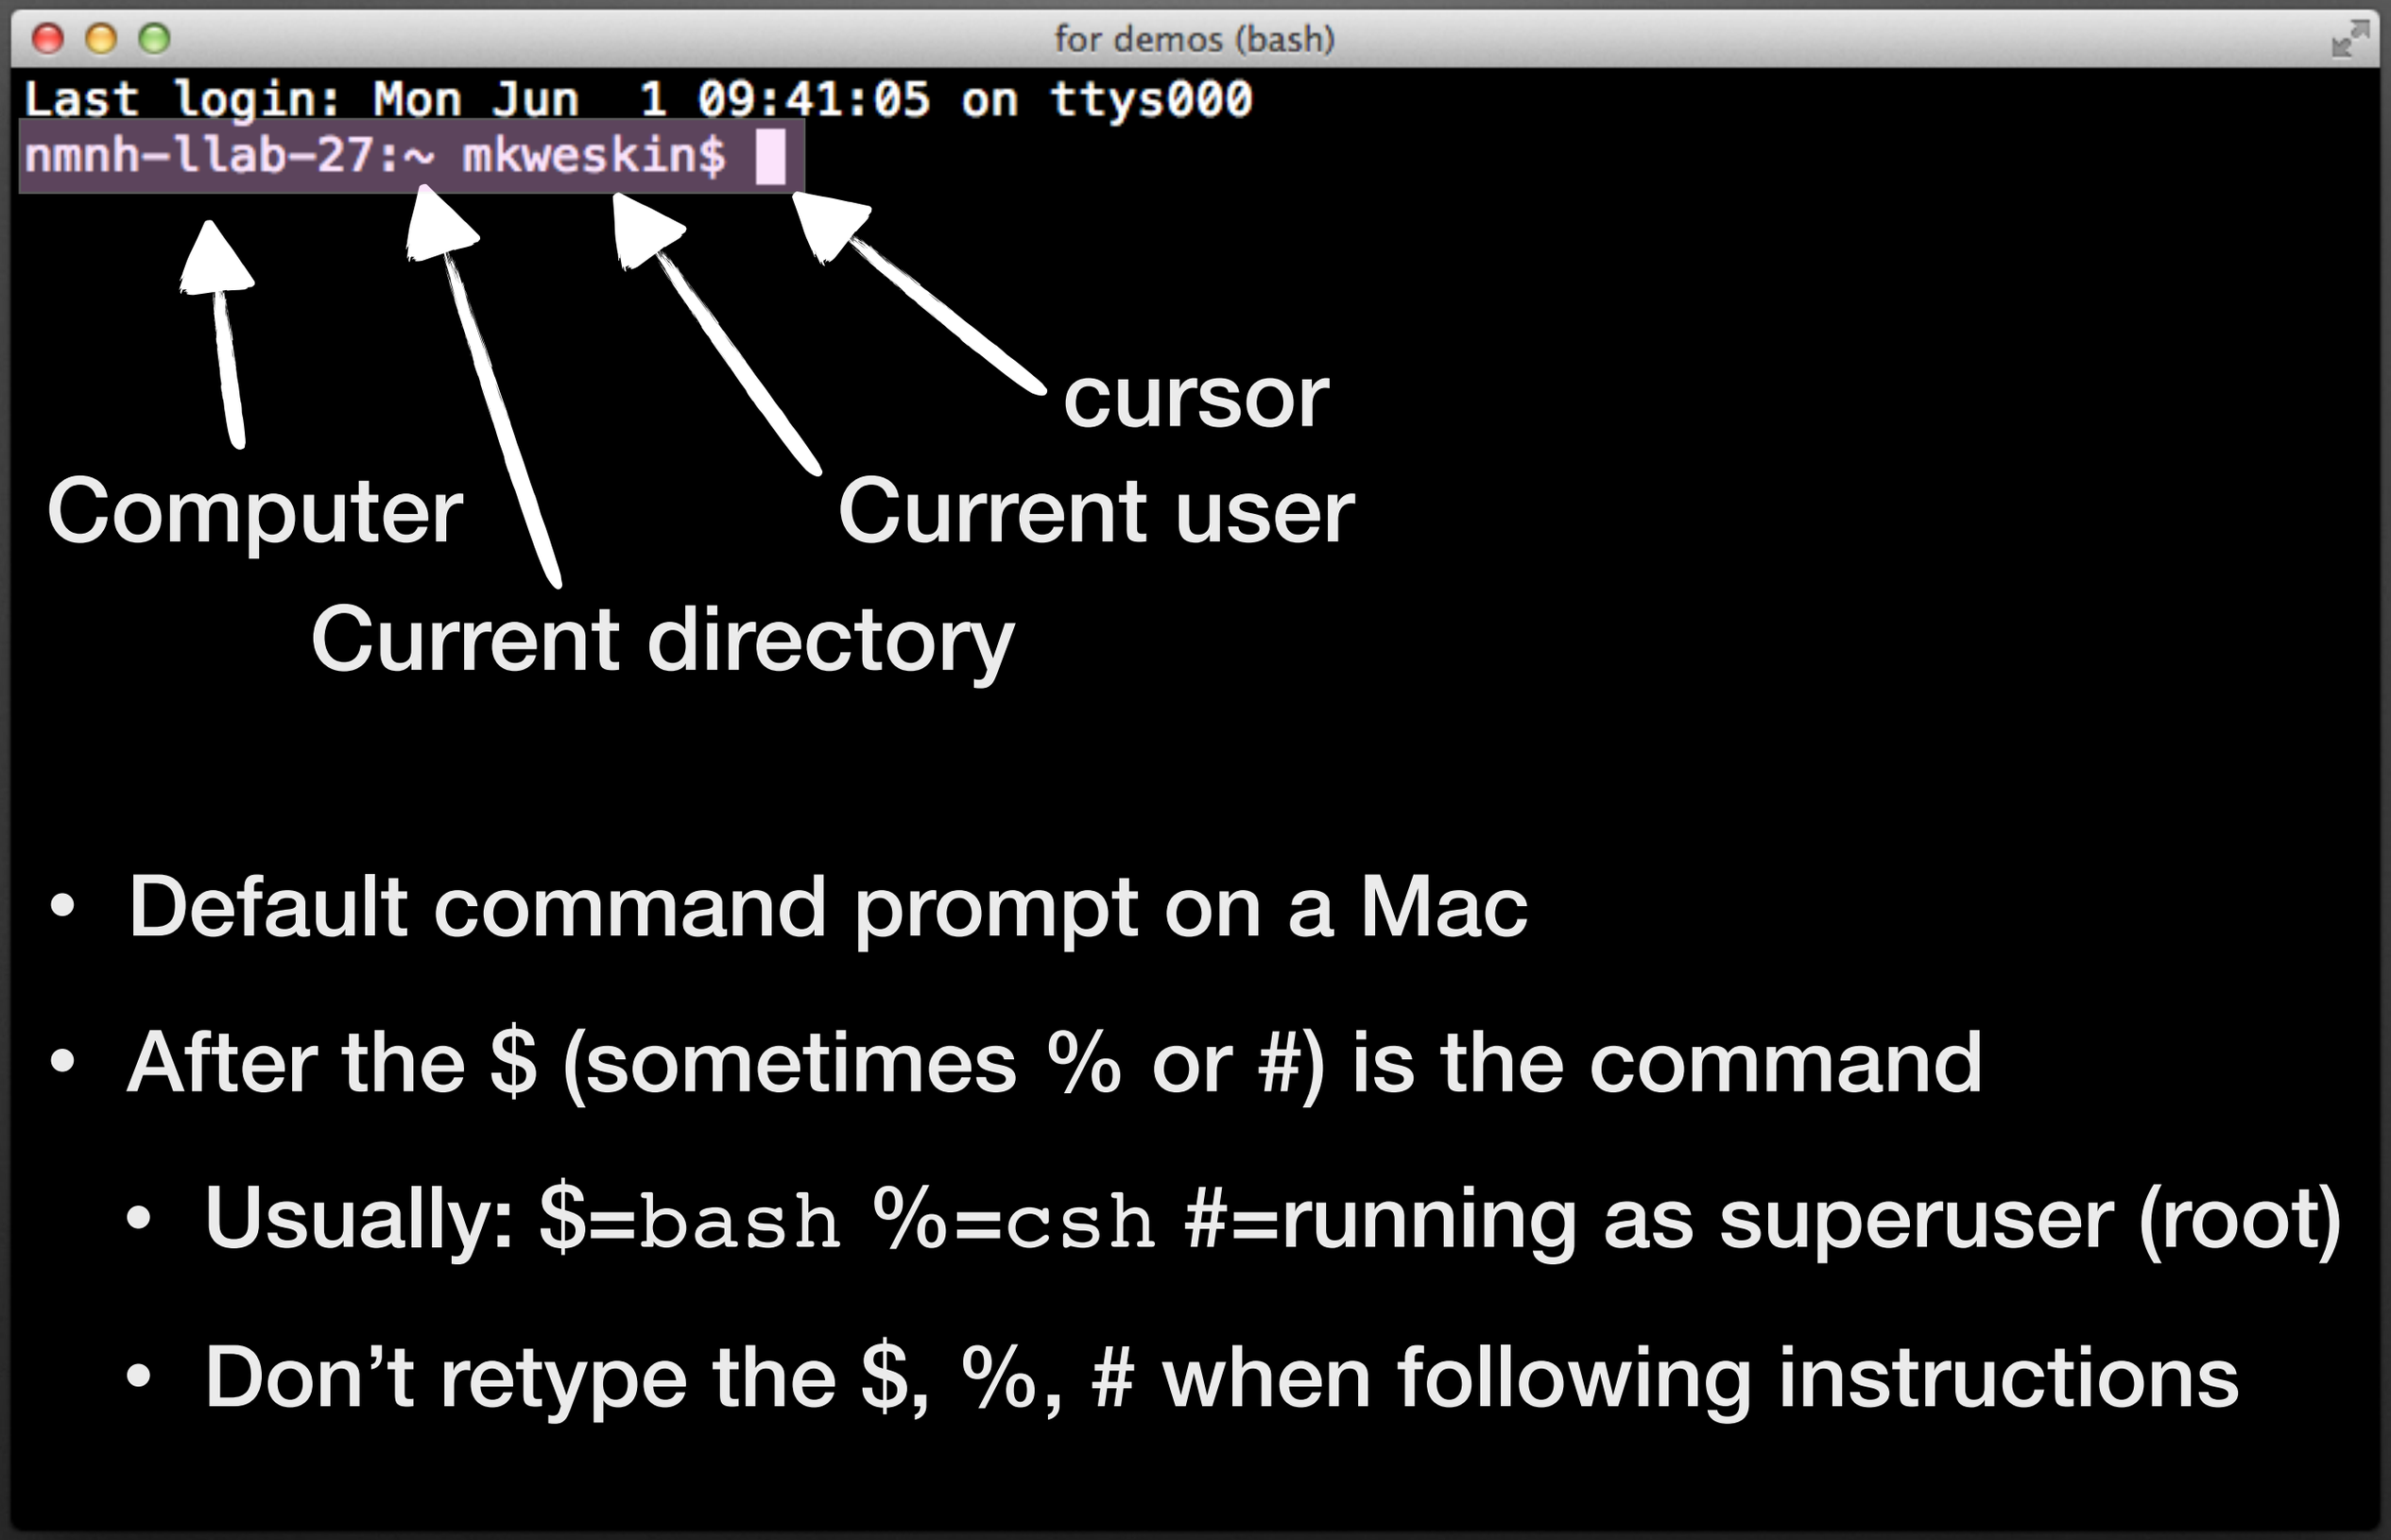
- USE:
  - Letters numbers _ - +

- AVOID:
  - `space < > & | ! ( ) ? * ' " \ $`
  - non-printable chars, emoji
  - names starting with – or ~

The command prompt…
Let’s run commands!

Starting the Terminal (Mac)





- Default command prompt on a Mac
- After the $ (sometimes % or #) is the command
  - Usually: $=`bash` %=`csh` #=running as superuser (root)
  - Don’t retype the $, %, # when following instructions

Current directory

- You’re always in a directory at the command prompt
  - Equivalent to window being show in the Mac Finder or Windows Explorer
  - Commands you run will affect files in this directory unless you specify another

Commands

```
command [options] arguments
```

```
$ ls -l ~/Downloads
```

- `command`: name of the command
- `options` (or flags or switches): additional program options
  - `-x` or `--name` (often: one hyphen for single letter, two for longer)
  - `[ ]` means optional
  - When sure it's a "regular" hyphen not — or –

- `arguments` (or parameter): file or data for program to use

Getting help

- `man` Manual page, reference instructions

```
$ man command
```

- Brief usage screen (varies by command)

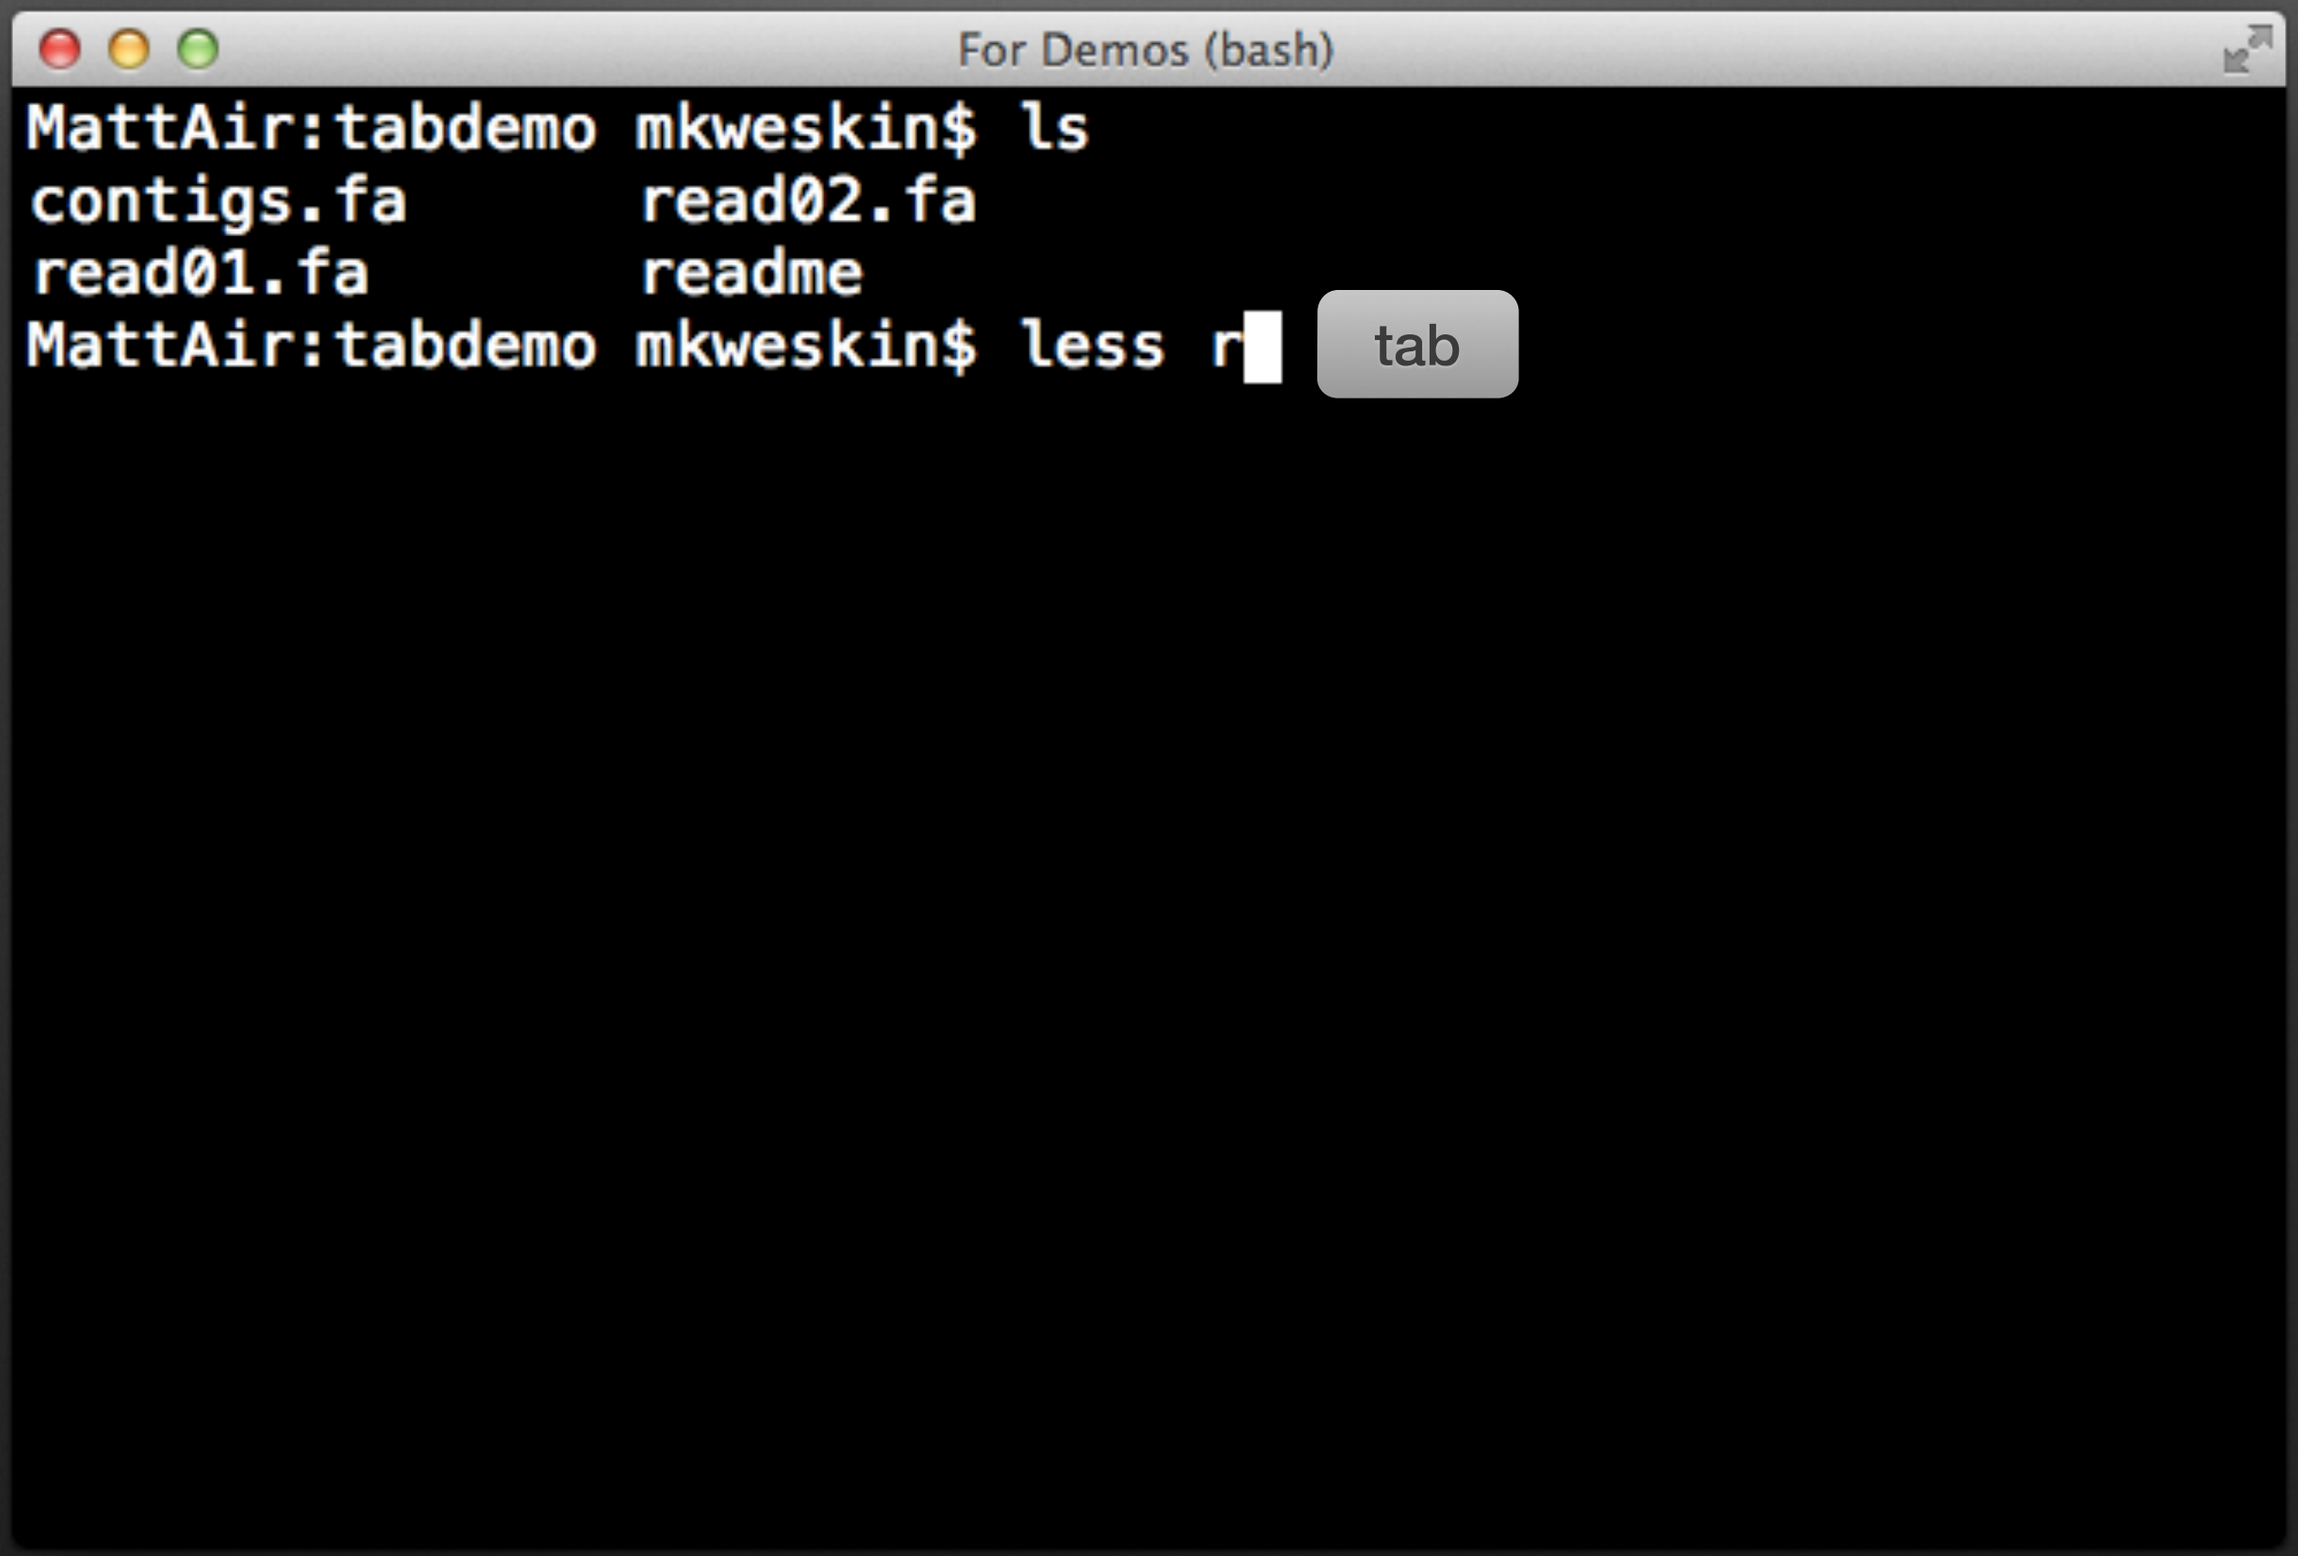
```
$ command -h
$ command -help
$ command --help
$ command
```

- Google! Try: `linux` *`command`*

Tab completion
(will change your life)

- Try it by starting to type a command or file name and then press tab
- Complete a file or command name until there is an ambiguity
- Tab twice to show all options available (in `bash` shell)

For Demos (bash)
MattAir:tabdemo mkweskin$ ls
contigs.fa read02.fa
read01.fa readme
MattAir:tabdemo mkweskin$

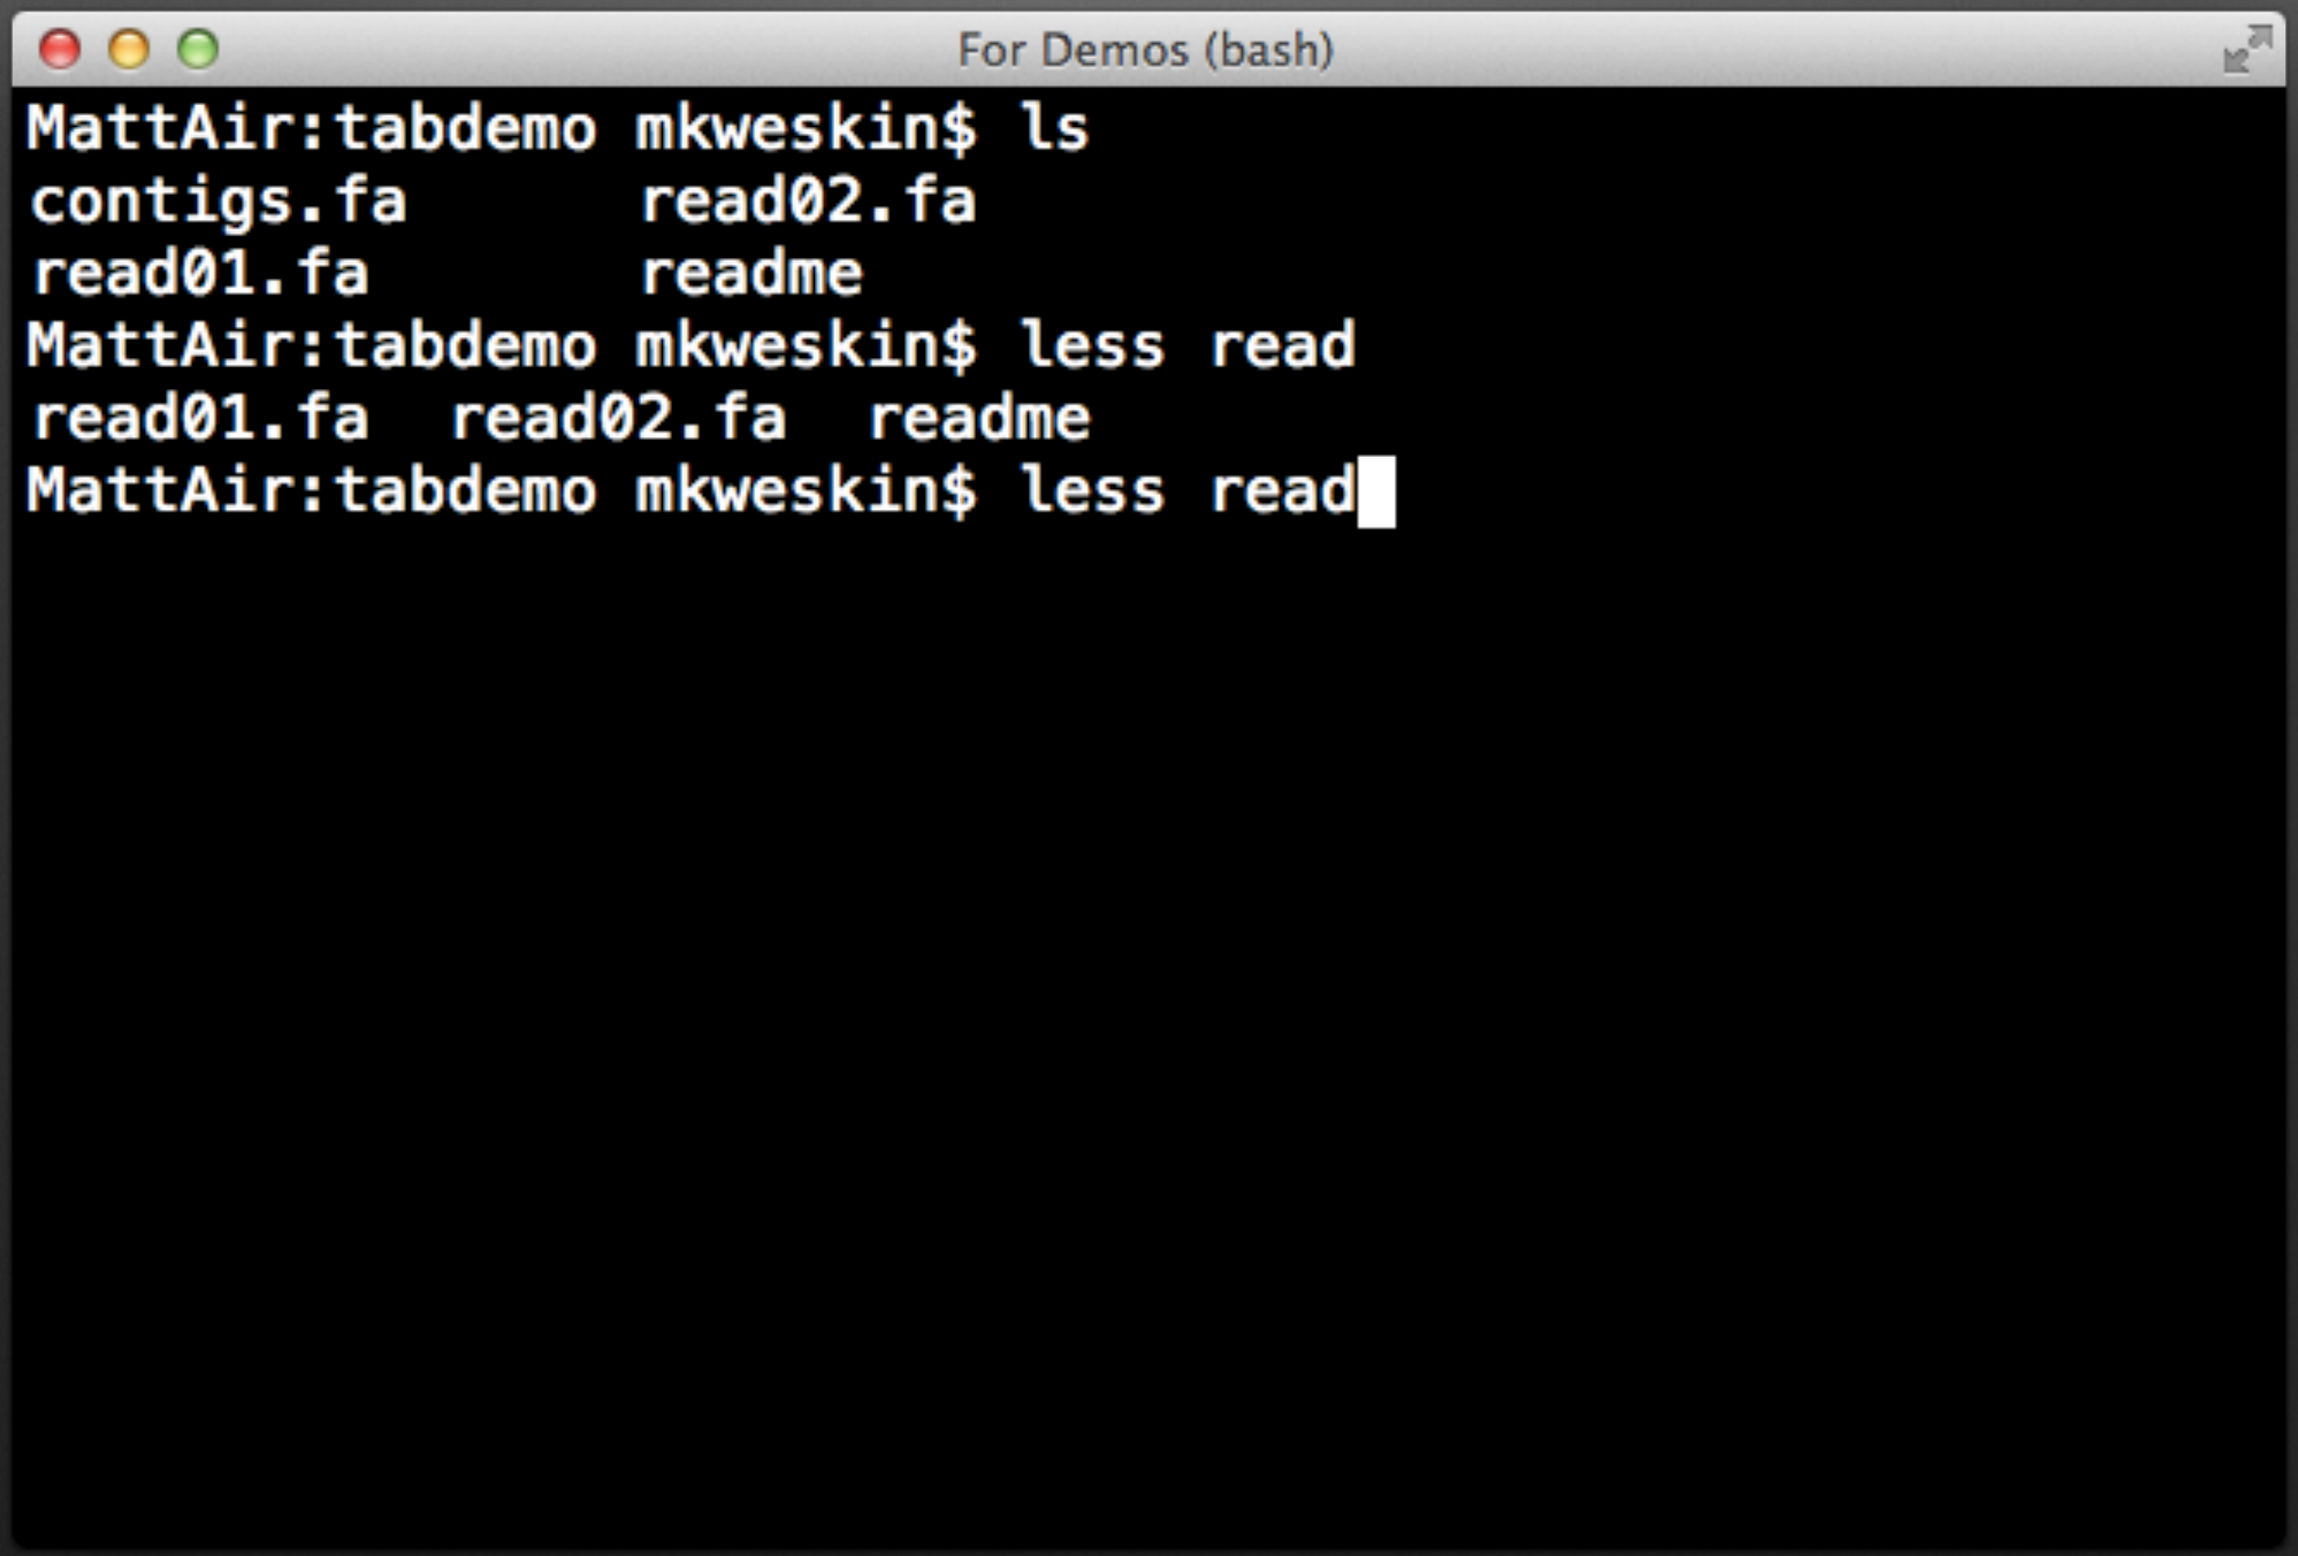


For Demos (bash)
MattAir:tabdemo mkweskin$ ls
contigs.fa read02.fa
read01.fa readme
MattAir:tabdemo mkweskin$ less r
tab

For Demos (bash)

```
MattAir:tabdemo mkweskin$ ls
contigs.fa      read02.fa
read01.fa       readme
MattAir:tabdemo mkweskin$ less read
```

tab tab



For Demos (bash)
MattAir:tabdemo mkweskin$ ls
contigs.fa read02.fa
read01.fa readme
MattAir:tabdemo mkweskin$ less read
read01.fa read02.fa readme
MattAir:tabdemo mkweskin$ less read

For Demos (bash)

```
MattAir:tabdemo mkweskin$ ls
contigs.fa      read02.fa
read01.fa       readme
MattAir:tabdemo mkweskin$ less read
read01.fa   read02.fa   readme
MattAir:tabdemo mkweskin$ less readm
```

tab

For Demos (bash)

```
MattAir:tabdemo mkweskin$ ls
contigs.fa       read02.fa
read01.fa        readme
MattAir:tabdemo mkweskin$ less read
read01.fa   read02.fa   readme
MattAir:tabdemo mkweskin$ less readme
```

space added automatically
Indicates tab completion is done

Wildcards
(globbing in Unix speak)

- `*` any string (length ≥ 0) of characters

```
$ ls -l *.txt
```

- `?` any one character

```
$ ls -l read0?.fasta
```

- `[abc]` any one character within the brackets

```
$ ls -l read[01].fasta
```

Working with files

`ls` = list directory contents

```
$ ls
Applications   Library
Desktop        Movies
Documents      Music
Downloads      Pictures
Geneious 7.1   Public
```

Common options:

- `-l` long listing: gives file type size and other info
- `-a` list all files including hidden files starting with “.”
- `-t` sorted by time last modified, newest at top
- `-tr` sorted by time last modified, reverse sorted newest at bottom

- Argument: Directory(s) or file(s) to list

cd = change directory

```
$ cd Downloads

$ cd ~/Downloads

$ cd ..
```

- Argument
  - Directory to move to. If you give a file instead you will get an error like this:

```
-bash: cd: foo.fasta: Not a directory
```

`mkdir` = make directory

```
$ mkdir mydir
$ mkdir ../mydir
```

- Arguments
  - Directory(s) to create

`rmdir` = remove directory

```
$ rmdir mydir
$ rmdir ../mydir
```

- Can only delete empty directory (use `rm -r` if full)

```
rmdir: mydir: Directory not empty
```

- Arguments
  - Directory(s) to create

`cp` = copy file

```
$ cp foo.fasta bar.fasta
$ cp -r mydir ~/Downloads
$ cp ../foo.fasta .
```

- Common options:
  - `-r` recursive copy, include directories. Otherwise error like:
    ```
    cp: omitting directory `mydir'
    ```
  - cp will overwrite current files!
  - `-i` (interactive, prompts before overwrite) 🌻
- Arguments
  - files/directories to copy, Last argument is destination

`mv` = move file

```
$ mv foo.fasta bar.fasta
$ mv mydir ~/Downloads
```

- `mv` will overwrite current files!
  - `-i` (interactive) 🌻
- Arguments
  - file/directory to move
  - Last argument is destination

`rm` = remove file

```
$ rm foo.fasta
$ rm -r mydir
```

- Common options:
  - `-r` recursive, include removing directories. Otherwise error:

```
rm: cannot remove `mydir': Is a directory
```

  - There's no undo, so check twice before using `rm` 
  - Be careful using wildcards. I never use `rm *` 
- Arguments
  - files/directories to remove (can be multiple)

pwd = print working directory

- Shows the full path of your current directory

```
$ pwd
/pool/cluster0/workshop
```

Stuck in a command

- `<control+c>` Will usually kill current program, sometimes `<control+d>`
- If that doesn't work (emacs, vi, less) Google: quit vi or `<control+z>` to suspend program (but then you have to kill it)

Viewing text files

Viewing full files
`cat` and `less`

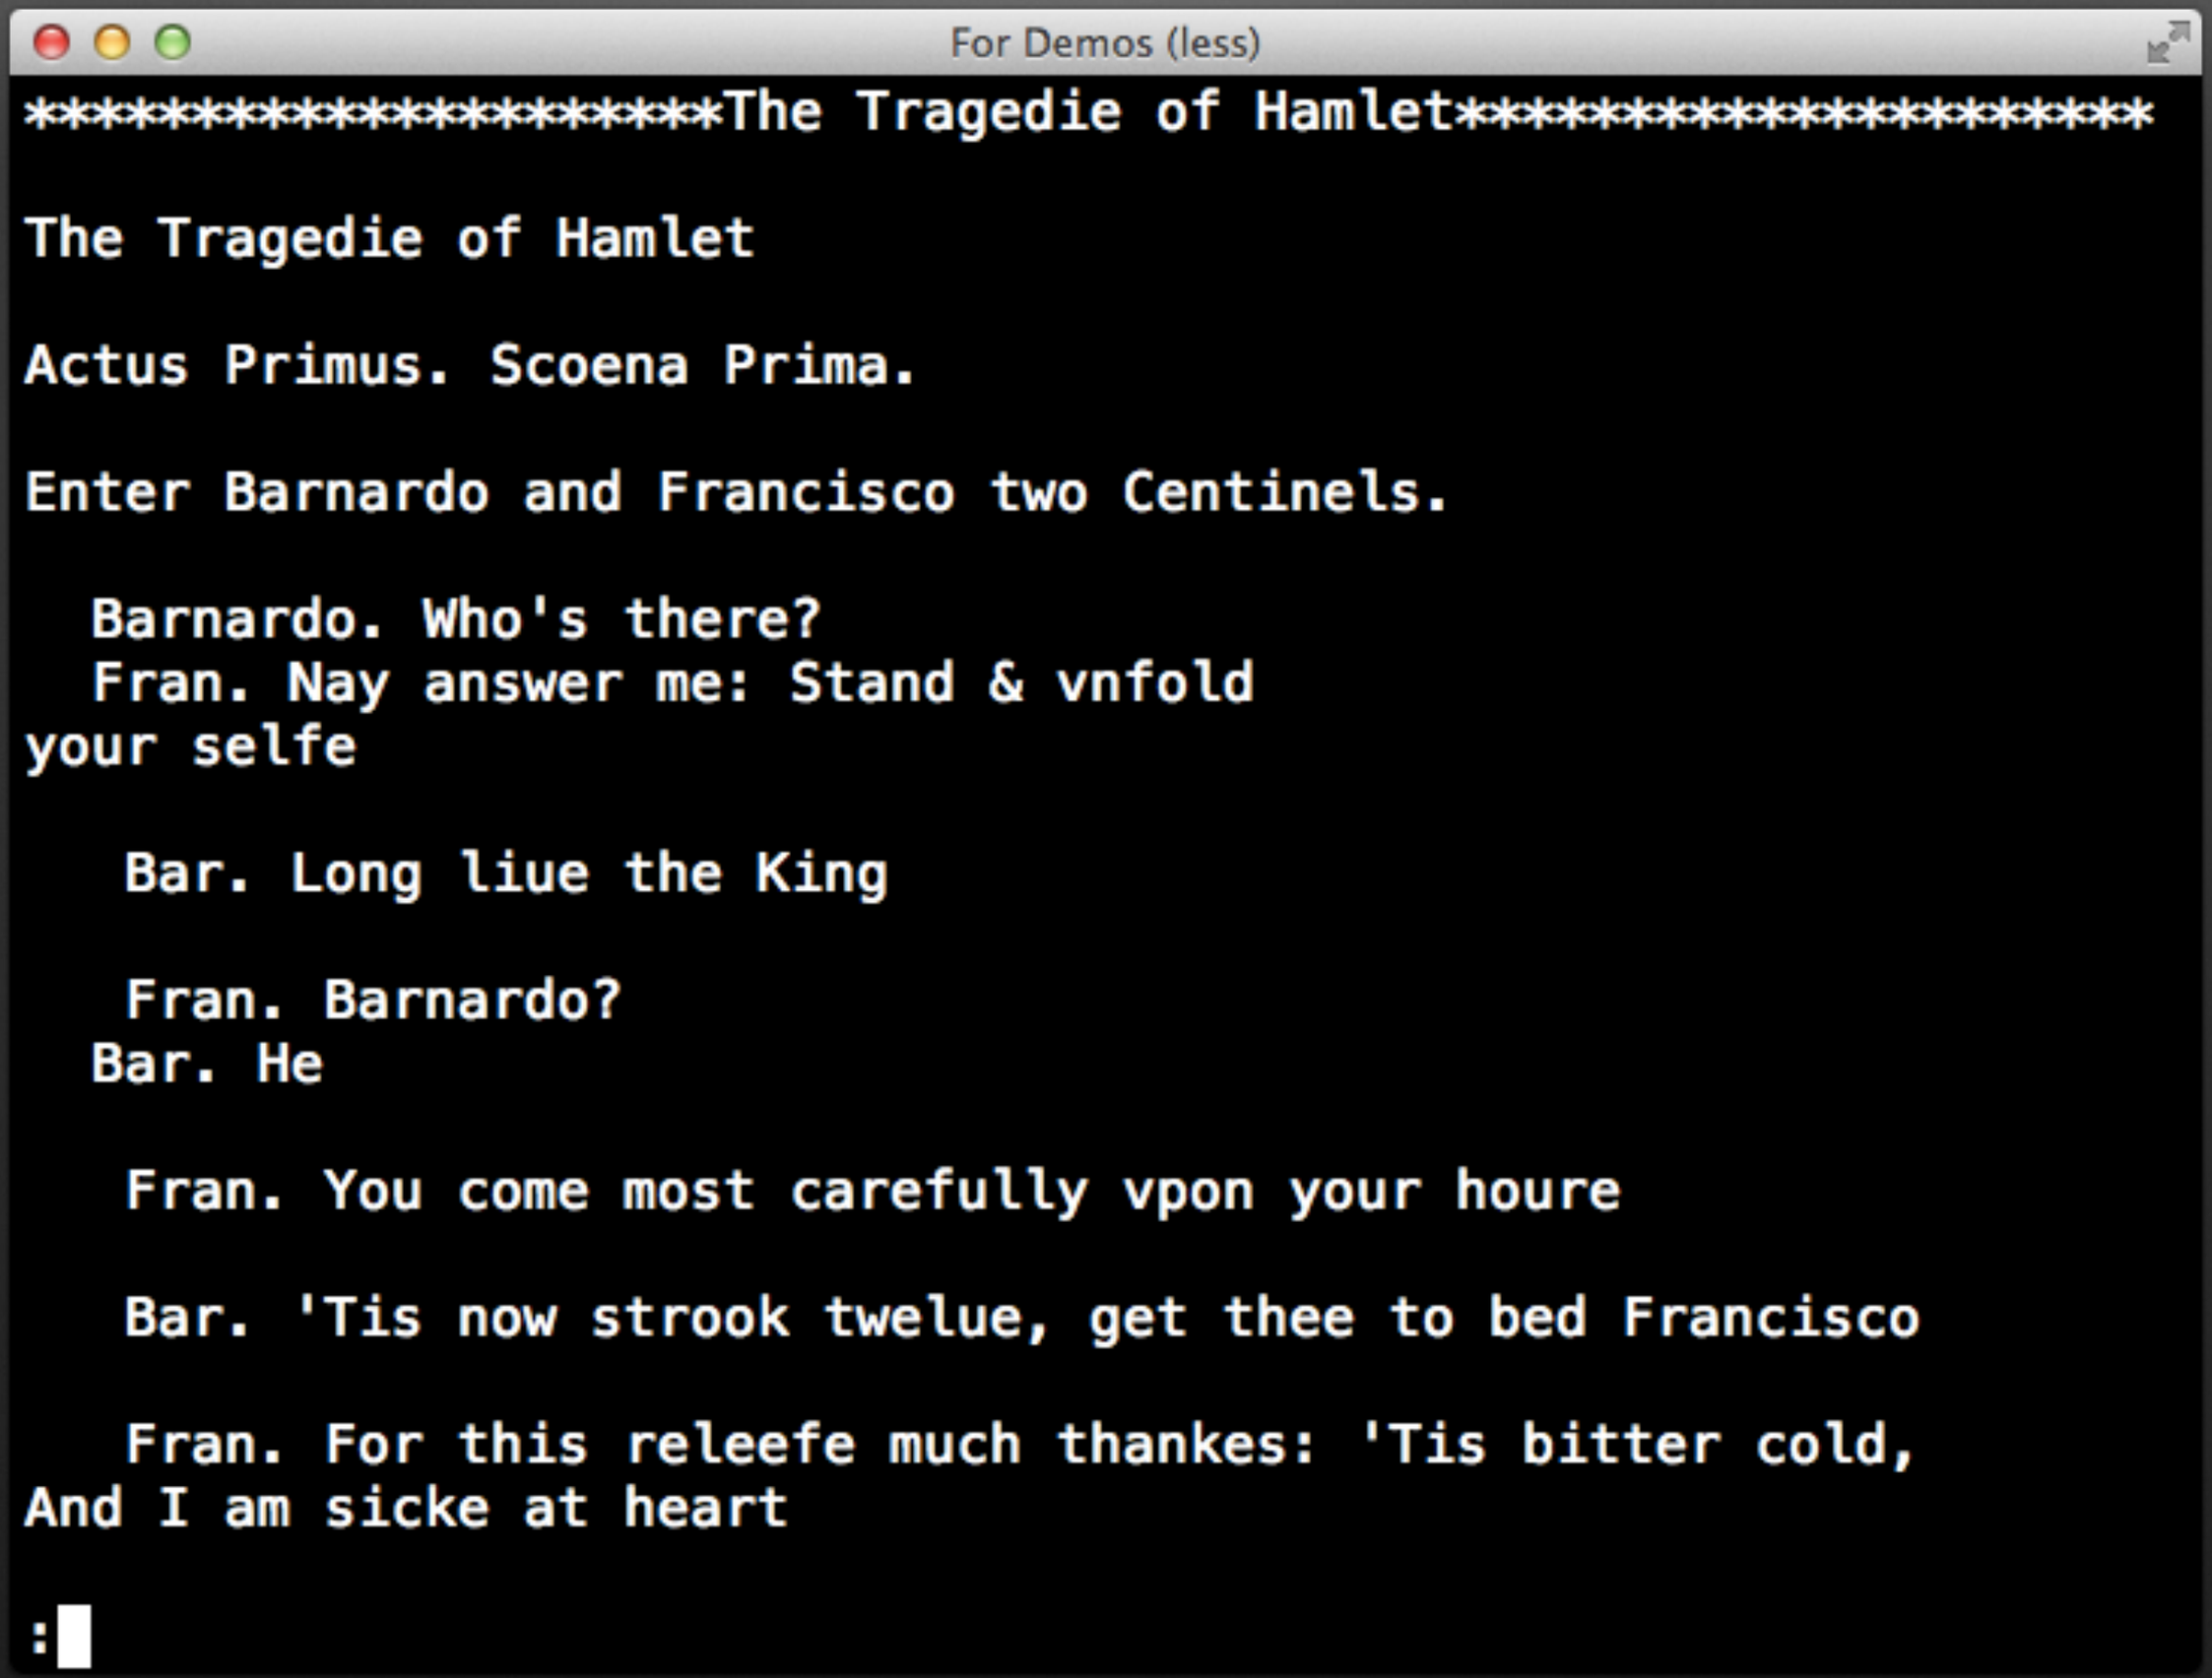
- Show FULL contents (or concatenate several files)

```
$ cat file
```

- Show file one screen at a time (one command, two names)

```
$ less file

$ more file
```



For Demos (less)
**********The Tragedie of Hamlet**********
The Tragedie of Hamlet
Actus Primus. Scoena Prima.
Enter Barnardo and Francisco two Centinels.
Barnardo. Who's there?
Fran. Nay answer me: Stand & vnfold
your selfe
Bar. Long liue the King
Fran. Barnardo?
Bar. He
Fran. You come most carefully vpon your houre
Bar. 'Tis now strook twelue, get thee to bed Francisco
Fran. For this releefe much thankes: 'Tis bitter cold,
And I am sicke at heart
:

`less` = interactive file display to screen

```
$ less foo.fasta
```

- Single key commands when running:
  - `q` quit
  - <space> forward one screen
  - <arrow up> <arrow down> move up/down one line
  - `/word` search for “word” in document (case sensitive)
    - `-i` to make case insensitive
  - `G` bottom of document
  - `gg` top of document

Viewing files- `head` and `tail`

- First 10 lines of file `$ head file`
  - `-<number>` to specify number of lines to show
    - e.g. `$head -40 myfile`
- Last 10 lines of file `$ tail file`
  - `-<number>` to specify number of lines to show
  - e.g. `$tail -10 myfile` or `$tail -10 job*.out`

Editing text files

Editing/creating text files

- You can edit and create files directly from the command line (on the remote system)
- `nano` easiest to get started with
- `vi` “pro” text editor, also see `emacs`
- `emacs` “pro” text editor, also see `vi`

`nano` = play on `pico`

```
$ nano foo.fasta

$ nano newfile.fasta
```

- Can edit a file or create a new file
- Arrow keys to navigate
- Use `<control+letter>` options at bottom (^=control-key)
  - `^x` = <control+x> exits
    - Will prompt to save changes “Save modified buffer”, type y to save and then return to use the same name

bio_user@hydra-3:~/Day1/data (ssh)

GNU nano 2.0.9 File: ecoli_ref-5m_small.fasta

```

echo = display text to output

```
$ echo “Hello world”

Hello world
```

- Display text to screen
- Why?
  - useful in scripting
  - Display variables ($PATH)

`which` = which directory is this command found?

```
$ which mkdir
/bin/mkdir
$ which java
/usr/java/latest/bin/java
```

- Shows location of the command being used to make sure it’s the right version

Connecting to Hydra

Moving to Hydra

- Linux cluster running Rocks (dervied from CentOS)
- Command line access only
- Home directory is `/home/<username>` BUT all data goes into `/pool/…`
- `<username>` means the user you login as (e.g. `kweskinm`)
- Only accessible from SI network including VPN/Citrix

This is a new Hydra, “Hydra-3”

- New software (OS and software packages)
- Mix of old and new hardware
- New logins (new passwords)
- Access to old user data

`ssh` = secure shell

Remote connection to another computer

```
nmnh-llab-27:~ mkweskin$ ssh user@hydra-login01.si.edu
Password:
[user@login3-1 ~]$
```

- Template: `ssh user@computer`
- Enter password for remote machine
- Change in prompt identifies you're no longer connected to your computer
- `$ exit` Closes session when you're done 🌻

PuTTY Security Alert
The server's host key is not cached in the registry. You have no guarantee that the server is the computer you think it is.
The server's rsa2 key fingerprint is:
ssh-rsa 2048 d8:8d:f2:3c:96:38:75:86:98:b0:ae:69:75:c3:20:2d
If you trust this host, hit Yes to add the key to PuTTY's cache and carry on connecting.
If you want to carry on connecting just once, without adding the key to the cache, hit No.
If you do not trust this host, hit Cancel to abandon the connection.
Yes
No

hydra-login01.si.edu - PuTTY

```
login as: kweskinm
Using keyboard-interactive authentication.
Password:
```

Network Sequencher putty.exe

kweskinm@login-3-1:~

```
login as: kweskinm
Using keyboard-interactive authentication.
Password:
Last login: Wed Jun 10 17:08:58 2015 from nmnh-llab-27.us.sinet.si.edu
Rocks 6.1.1 (Sand Boa)
--------------------------------------------------------------------------
Welcome to the HPC/SI cluster Hydra-3

Documentation is available at https://hydra-3.si.edu

Please change your password every 90 days. Your account will be locked
if it is inactive for 90+7 days, email dingdj@si.edu to unlock it for
you.

To change your password, use the command 'passwd' on the login node
(this host), and then ssh to 'hydra-3' and do the same. If you don't,
your password will be reset to the one on 'hydra-3' (the head node)
where the master records are kept.
==========================================================================

[kweskinm@login-3-1 ~]$
```

`passwd` = change password

```
$ passwd
```

- Enter old password then new password and confirm
- Useful on remote systems (e.g. Hydra), but not recommended way to change password on a Mac
